Technical Support

Technical Support maintains support centers globally. All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policies. For information about our support offerings and how to contact Technical Support, visit our website:

https://www.veritas.com/support

You can manage your Veritas account information at the following URL:

https://my.veritas.com

If you have questions regarding an existing support agreement, please email the support agreement administration team for your region as follows:

Worldwide (except Japan)       CustomerCare@veritas.com
Japan                        CustomerCare_Japan@veritas.com

Documentation

Make sure that you have the current version of the documentation. Each document displays the date of the last update on page 2. The latest documentation is available on the Veritas website:

https://sort.veritas.com/documents

Documentation feedback

Your feedback is important to us. Suggest improvements or report errors or omissions to the documentation. Include the document title, document version, chapter title, and section title of the text on which you are reporting. Send feedback to:

NB.docs@veritas.com

You can also see documentation information or ask a question on the Veritas community site:

http://www.veritas.com/community/

Veritas Services and Operations Readiness Tools (SORT)

Veritas Services and Operations Readiness Tools (SORT) is a website that provides information and tools to automate and simplify certain time-consuming administrative tasks. Depending on the product, SORT helps you prepare for installations and upgrades, identify risks in your datacenters, and improve operational efficiency. To see what services and tools SORT provides for your product, see the data sheet:

Introduction and notes

This chapter includes the following topics:

- About the NetBackup Add-in for System Center Virtual Machine Manager (SCVMM)
- Notes on the NetBackup Add-in for SCVMM
- Updates to this guide for NetBackup 8.1

### About the NetBackup Add-in for System Center Virtual Machine Manager (SCVMM)

You can use the NetBackup Add-in for Microsoft System Center Virtual Machine Manager (SCVMM) to recover virtual machines from NetBackup backup images.

You can use the add-in to do the following in the SCVMM console:

- Recover the full virtual machine to its original location or to an alternate location.
- Monitor the progress of recovery jobs that the add-in initiated.

*Figure 1-1* shows an SCVMM environment with NetBackup servers and the NetBackup add-in.
Notes on the NetBackup Add-in for SCVMM

Note the following about the NetBackup add-in:

- This release of the NetBackup add-in for SCVMM does not support the following: Monitoring of virtual machine backups, restore of individual files from virtual machine backups, or restore of the virtual machine to a staging location. See “Notes on restoring Hyper-V virtual machines with the Recovery Wizard” on page 34.

- To use the NetBackup add-in, you must log on to the SCVMM console with the Administrator role. For any user that is logged on with a different role, the add-in functionality is disabled.

- The NetBackup add-in must be installed by every user who wants to use it. See “Accessing the Recovery Wizard” on page 35.

- Regarding future versions of the NetBackup Add-in for SCVMM: Due to Microsoft limitations on 3rd party add-ins, the NetBackup add-in does not support upgrades to the existing version of the add-in. When a new release of the add-in is available, the current version must be uninstalled.

Note: You can upgrade SCVMM without needing to reinstall the add-in.
Updates to this guide for NetBackup 8.1

This guide contains the following changes:

- Updated the add-in installation procedure to reflect the new Veritas Entitlement Management System.
  See “Installing the NetBackup Add-in for SCVMM” on page 9.

- Added new options to the manageClientCerts command to provide additional flexibility for communication between the NetBackup master server and the SCVMM console host.
  See “Adding or deleting an additional host name or IP address for an authentication token” on page 27.
  See “Renewing an authorization token” on page 31.
  See “Troubleshooting master server communication failures in the NetBackup Add-in for SCVMM” on page 52.
Installing the NetBackup Add-in for SCVMM

This chapter includes the following topics:

■ Requirements for the NetBackup Add-in for SCVMM
■ Installing the NetBackup Add-in for SCVMM
■ Installation message: Add-in cannot be installed
■ Installation message regarding localized environments
■ Uninstalling the NetBackup Add-in for SCVMM
■ Configuring the NetBackup Recovery Wizard

Requirements for the NetBackup Add-in for SCVMM

For a list of supported NetBackup versions and SCVMM versions, see the NetBackup Software Compatibility List (SCL) available from the following location:

NetBackup Master Compatibility List

Installing the NetBackup Add-in for SCVMM

This topic describes how to obtain the installation files and install the NetBackup Add-in for SCVMM.
Table 2-1 NetBackup Add-in for SCVMM: installation requirements

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>NetBackup add-in installation file</td>
<td>You can download the installation file NetBackup_8.1_Plugins.zip from the following location: <a href="https://my.veritas.com/">https://my.veritas.com/</a></td>
</tr>
<tr>
<td>SCVMM console host</td>
<td>Download the installation .zip file to the SCVMM console host, or to a different Windows host. <strong>Note:</strong> The Windows host must have network connectivity to the SCVMM server.</td>
</tr>
</tbody>
</table>
| SCVMM server(s) and their credentials| When the add-in is installed, it runs in the SCVMM console. The following are required to complete the add-in installation:  
  ■ Host name or IP address of each SCVMM server.  
  ■ User name and password of each SCVMM server.  
  ■ Port number for each SCVMM server (default is 443). |
| Additional user access               | Additional user access may be needed in the following situation:  
  ■ User Account Control is enabled on the SCVMM console host.  
  ■ The user who installs the add-in is not the user who installed the System Center.  
  See “Installation message: Add-in cannot be installed” on page 14. |

To install the NetBackup Add-in for SCVMM

1. On the MyVeritas website, log on with your MyVeritas account:
   https://my.veritas.com/
   For logon assistance, see your account Administrator, or contact Veritas:
   Veritas Support
   Email: CustomerCare@veritas.com

2. Click **Licensing** on the **MyVeritas** menu bar.
   The Veritas Entitlement Management System (VEMS) appears.

3. Click **Entitlements**, then click **More Options**.

4. In the **Product Name** field, enter NetBackup and click **Apply Filters**.
   Your NetBackup product entitlements appear in the list.
5 For one of the NetBackup products in the list, click the Download Product icon under Actions.

A list of NetBackup product versions appears.

6 For one of the NetBackup products, click the Download Product icon again.

7 Select the NetBackup_8.1_Plugins.zip file and download the file to the SCVMM console host.

For assistance with the Veritas Entitlement Management System, see the following article:

Veritas Entitlement Management User's Guide

8 Unzip the downloaded NetBackup_8.1_Plugins.zip file and locate the VRTSNBUAddIn.zip file.

The path to the VRTSNBUAddIn.zip file is the following:

\NB_8.1_Plugins\NBscvmmAddIn\NetBackup_scvmmAddIn_Win\VRTSNBUAddIn.zip

Note: Do not unzip the VRTSNBUAddIn.zip file. That zip file is needed for installation of the add-in.

Zip files for other NetBackup plug-ins are also included in the downloaded NetBackup_8.1_Plugins.zip file. Those files are not required for the NetBackup Add-in for SCVMM.

9 Launch the SCVMM console and connect to the SCVMM server.

You need the server's host name or IP address, and its logon credentials.

10 In the SCVMM console, open the Settings workspace, then click the Import Console Add-in option in the SCVMM ribbon.

The Import Console Add-in Wizard appears.
11 In the Select an Add-in screen, click Browse and browse for the VRTSNBUAddIn.zip file.

Several warnings appear. These warnings can be safely ignored.

12 Click Continue installing this add-in anyway.

If the Import Console Add-in Wizard states "The Add-in cannot be installed," you may need additional user access.

See “Installation message: Add-in cannot be installed” on page 14.

When you have the required user access, browse for the NetBackup add-in file again (step 11) and continue this installation procedure.
13 On the Summary screen, click Finish.

If the NetBackup add-in is installed on a Windows host that has a non-English system locale, SCVMM may issue a message when the installation completes. See “Installation message regarding localized environments” on page 18.

The imported add-in appears in the Jobs window of the SCVMM console, and in the Settings workspace under Console Add-ins.
If you had logged into the SCVMM console with your own credentials, restart the SCVMM console when prompted.

**Note:** If you selected the *Use current Microsoft Windows session identity* option, a restart is not required.

**Note:** To use the NetBackup add-in, you must log on to the SCVMM console with the Administrator role. If you log on to SCVMM with a different role, the add-in functionality is disabled.

**Note:** The first time you use the NetBackup add-in, an End User License Agreement (EULA) appears. To use the add-in, you must accept the EULA.

---

**Installation message: Add-in cannot be installed**

Lack of user permissions may cause the error "Add-in cannot be installed" during installation of the NetBackup Add-in for SCVMM.

For example, the error may occur in the following situation:
User Account Control is enabled on the SCVMM console host, and

- The user who installs the add-in on the SCVMM console is not the user who installed the System Center.

During the add-in installation, the following message appears:

![Add-in cannot be installed message](image)
To grant installation permissions to all authenticated users on the SCVMM console host

1. On the SCVMM console host, browse to the following location:
   
   C:\Program Files\Microsoft System Center 2012\Virtual Machine Manager\bin

2. Right-click the AddInPipeline folder, and click **Properties**.

3. Click **Advanced** on the **Security** tab, and click **Continue**.
4 Select the **BUILTIN** group, and click **Edit**.

5 Click **Select a principal**.
6 Enter **Authenticated Users**, and click **OK**.

![Select User, Computer, Service Account, or Group dialog](image)

7 To close each properties dialog, click **OK**.

   The following Microsoft article contains further information on this issue:
   
   [http://support.microsoft.com/kb/2904712](http://support.microsoft.com/kb/2904712)

8 To install the NetBackup Add-in for SCVMM:

   See “Installing the NetBackup Add-in for SCVMM” on page 9.

---

**Installation message regarding localized environments**

If the NetBackup add-in is installed on a Windows host that has a non-English system locale, SCVMM may issue a message when the installation completes. The message states that an argument cannot be validated because it contains more than 64 characters. The error results from a Microsoft limitation on the length of the add-in name, which varies with the selected locale.

For example: The following appears if Windows was set to the French system locale:
19 Installing the NetBackup Add-in for SCVMM

Installation message regarding localized environments

Note: This message can be ignored. The add-in is installed correctly.
Uninstalling the NetBackup Add-in for SCVMM

To uninstall the NetBackup Add-in for SCVMM

1. In the SCVMM console, open the **Settings** workspace.

2. In the **Console Add-ins** node, click on the Veritas NetBackup Add-in and then click **Remove**.

3. When you are prompted to confirm the removal, click **Yes**.

   The uninstallation should appear in the **Jobs** window of the SCVMM console.

Configuring the NetBackup Recovery Wizard

To use the NetBackup Recovery Wizard to restore virtual machines, configure the following:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Reference topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create an authentication token file.*</td>
<td>See &quot;Creating an authentication token for the NetBackup add-in for SCVMM&quot; on page 21.</td>
</tr>
</tbody>
</table>
Table 2-2  Configuring the NetBackup Recovery Wizard (continued)

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
<th>Reference topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Authorize the NetBackup Add-in to restore virtual machines.</td>
<td>See “Authorizing the NetBackup add-in to restore virtual machines” on page 23.</td>
</tr>
</tbody>
</table>

*In certain circumstances, it may be necessary to associate an authentication token with additional SCVMM console host names or IP addresses:

See “Adding or deleting an additional host name or IP address for an authentication token” on page 27.

Creating an authentication token for the NetBackup add-in for SCVMM

To allow the add-in to restore VMs, generate an authentication token on the NetBackup master server (or certificate on the NetBackup appliance as master server). When an authentication token is created on a master server and deployed on the NetBackup add-in, it allows that add-in to restore any Hyper-V backups from that master server.
To create an authentication token on the NetBackup master server

1. Enter the following on the master server:
   - Windows
     ```
     install_path\NetBackup\wmc\bin\install\manageClientCerts.bat -create clientName
     ```
   - UNIX, Linux
     ```
     /usr/openv/wmc/bin/install/manageClientCerts -create clientName
     ```
   *clientName* is the DNS name of the SCVMM console host where the add-in is installed. The `manageClientCerts` command returns the location of a compressed file that contains the authentication token.

   **Note:** If the SCVMM console host is a separate host from the SCVMM server, generate the token for the SCVMM console host (not for the SCVMM server host name).

2. Provide the compressed authentication token file to the SCVMM server administrator.

   **Caution:** Be sure to share or send the compressed file in a secure manner.

   With the master server token, the add-in can be authorized to restore virtual machines.

   See “Authorizing the NetBackup add-in to restore virtual machines” on page 23.

To create an authentication token (certificate) on the NetBackup appliance as master server

1. To generate the certificate, see the "Manage > Certificates" topic in the *NetBackup Appliance Administrator's Guide*, available from this location:
   ```
   http://www.veritas.com/docs/000002217
   ```

2. Provide the compressed certificate file to the SCVMM administrator.

   **Caution:** Be sure to share or send the compressed file in a secure manner.

   With the master server certificate, the add-in can be authorized to restore virtual machines.

   See “Authorizing the NetBackup add-in to restore virtual machines” on page 23.
Authorizing the NetBackup add-in to restore virtual machines

The NetBackup master server initiates and controls the backup of virtual machines. To use the add-in to restore virtual machines, you must obtain a master server authentication token from the NetBackup administrator. Then you can authorize the add-in to restore the virtual machines that were backed up by that master server.

To authorize the add-in to restore virtual machines (or to edit or delete an authorization)

1  Ask the NetBackup administrator to provide an authentication token file.
   See “Creating an authentication token for the NetBackup add-in for SCVMM” on page 21.

2  Copy the authentication token file to the computer or laptop where the SCVMM console is launched.
   Make a note of the location.

3  In the SCVMM console ribbon, click the NetBackup option.
4 Click **Manage Master Servers**.
5 Enter the following under **Add Master Server** to specify a NetBackup master server and its authentication token.

**Add Master Server**

- **Master Server Name**
  Enter the fully qualified domain name of the master server.

- **Web services port**
  If the NetBackup administrator has not changed the port, accept the default (8443). Otherwise, contact the administrator for the correct port number.

- **Authentication token**
  Click **Browse** to select the authentication token file that the NetBackup administrator provided.
  Click **Add**. The server is added to the list of master servers that the add-in can communicate with.

6 To verify that the SCVMM console can communicate with the master server, click **Check Status**.

If the communication is successful, the **Connection Status** field reads **Connected**.

7 To add other master servers and their authentication tokens, click **Add Master Server** in the upper right and repeat step 5 and 6.

8 To delete an authorization, click the delete icon next to the master server name.

When the authorization is deleted, the add-in can no longer restore from the backups that the master server performed.
To edit an authorization, click the edit icon opposite the master server name.

You can enter a different web services port, or click **Update Token** to select a different authentication token.
Adding or deleting an additional host name or IP address for an authentication token

The `manageClientCerts` command generates an authentication token for a specific SCVMM console host. The token gives the SCVMM console host access to the NetBackup master server where the token was generated. The token works if the SCVMM console host name is identical to the name that was entered on the `manageClientCerts` command.

For some environments, it may be necessary to allow the token to work with additional host names or IP addresses. An example is a clustered SCVMM server:
the request for access to the NetBackup master may come from a different host name or IP address than the one that was provided when the token was generated.

To allow access to NetBackup from such environments, you can use the `manageClientCerts` command to do the following:

- Add another host name (or IP address) of the SCVMM console host for the existing token. The added host name or IP address is referred to as an alias. Note: You can add multiple aliases for a token. Note that IPv4 and IPv6 addresses are supported.
- Delete a host name or IP address from a token.
- Allow the token to be used on any SCVMM console host.
- List existing aliases for a token.

The `manageClientCerts` command is in the following location:

**Windows:**

`install_path\NetBackup\wmc\bin\install\manageClientCerts.bat`

**UNIX, Linux:**

`/usr/openv/wmc/bin/install/manageClientCerts`

**Table 2-3**

<table>
<thead>
<tr>
<th>Task</th>
<th>Enter the following on the NetBackup master server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add a host name</td>
<td><code>manageClientCerts -addAlias host_name_used_to_generate_token -HOST additional_host_name_for_token</code></td>
</tr>
</tbody>
</table>

Where `host_name_used_to_generate_token` is the host name that was specified when the token was generated, and `additional_host_name_for_token` is the additional host name of the SCVMM console host.

For example:

```
manageClientCerts -addAlias SCVMM1 -HOST SCVMM1.example.com
```

Command output:

```
Successful -addAlias, for client: SCVMM1, type: HOST, alias: SCVMM1.example.com
```

In this example, the added host name is `SCVMM1.example.com`.

**Note:** You can add multiple host names for a token. Add one host name for each instance of `manageClientCerts`. 28
Table 2-3  Add a host name or IP address for an existing authentication token (continued)

<table>
<thead>
<tr>
<th>Task</th>
<th>Enter the following on the NetBackup master server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add an IP address or range of IP addresses</td>
<td>`manageClientCerts -addAlias host_name_used_to_generate_token -IP IP_address_for_token</td>
</tr>
<tr>
<td></td>
<td>Where <code>host_name_used_to_generate_token</code> is the host name that was specified when the token was generated. The IP address to add can be a single address (<code>IP_address_for_token</code>) or a range of addresses (<code>IP_address_with_netmask_for_token</code>). For example:</td>
</tr>
<tr>
<td>To add a single IP address:</td>
<td><code>manageClientCerts -addAlias SCVMM1 -IP 10.80.154.1</code></td>
</tr>
<tr>
<td>To add a range of IP addresses using a netmask:</td>
<td><code>manageClientCerts -addAlias SCVMM1 -IP 10.80.154.0/29</code></td>
</tr>
<tr>
<td>In this example, 10.80.154.0/29 allows 6 hosts with IP addresses from 10.80.154.1 to 10.80.154.7 to use the same token. <strong>Note:</strong> For a range of IP addresses, <code>manageClientCerts</code> supports IP net masking, sometimes called Classless Inter-Domain Routing notation (CIDR).</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> You can add multiple IP addresses for a token. If not adding a range of addresses, add one IP address for each instance of <code>manageClientCerts</code>.</td>
<td></td>
</tr>
<tr>
<td><strong>Note:</strong> IPv4 and IPv6 addresses are supported.</td>
<td></td>
</tr>
<tr>
<td>Allow the token to operate with any host</td>
<td><code>manageClientCerts -addAlias host_name_used_to_generate_token -ANY</code></td>
</tr>
<tr>
<td>Where <code>host_name_used_to_generate_token</code> is the host name that was specified when the token was generated. <code>-ANY</code> allows any host or any IP address to communicate with the NetBackup server by means of this token. <strong>Caution:</strong> Use the <code>-ANY</code> option with care. Allowing any host to use the token may introduce a security risk.</td>
<td></td>
</tr>
</tbody>
</table>

Table 2-4  Remove a host name or IP address from an existing authentication token

<table>
<thead>
<tr>
<th>Task</th>
<th>Enter the following on the NetBackup master server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete a host name</td>
<td><code>manageClientCerts -deleteAlias host_name_used_to_generate_token -HOST host_name_to_delete</code></td>
</tr>
<tr>
<td>Where <code>host_name_used_to_generate_token</code> is the host name that was specified when the token was generated, and <code>host_name_to_delete</code> is the name to be removed.</td>
<td></td>
</tr>
</tbody>
</table>
Table 2-4  Remove a host name or IP address from an existing authentication token (continued)

<table>
<thead>
<tr>
<th>Task</th>
<th>Enter the following on the NetBackup master server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete an IP address</td>
<td>manageClientCerts -deleteAlias host_name_used_to_generate_token -IP IP_address_to_delete</td>
</tr>
<tr>
<td></td>
<td>Where host_name_used_to_generate_token is the host name that was specified when the token was generated, and IP_address_to_delete is the IP address to be removed.</td>
</tr>
<tr>
<td>Delete the -ANY option</td>
<td>manageClientCerts -deleteAlias host_name_used_to_generate_token -ANY</td>
</tr>
<tr>
<td></td>
<td>Where host_name_used_to_generate_token is the host name that was specified when the token was generated. The -ANY option is removed from the token. If particular aliases (host names or IP addresses) had been added for the token, those aliases remain in force.</td>
</tr>
</tbody>
</table>

Table 2-5  List the host names or IP addresses (aliases) that have been defined for a token

<table>
<thead>
<tr>
<th>Task</th>
<th>Enter the following on the NetBackup master server:</th>
</tr>
</thead>
<tbody>
<tr>
<td>List host names or IP addresses (aliases)</td>
<td>manageClientCerts -listAliases host_name_used_to_generate_token</td>
</tr>
<tr>
<td></td>
<td>Where host_name_used_to_generate_token is the host name that was specified when the token was generated.</td>
</tr>
<tr>
<td></td>
<td>For example:</td>
</tr>
<tr>
<td></td>
<td>manageClientCerts -listAliases SCVMM1</td>
</tr>
<tr>
<td></td>
<td>Command output:</td>
</tr>
<tr>
<td></td>
<td>Aliases for SCVMM1:</td>
</tr>
<tr>
<td></td>
<td>HOST = SCVMM1.example.com</td>
</tr>
<tr>
<td></td>
<td>In this example, the alias is SCVMM1.example.com. If the token was set with the -ANY option (to accept connections from any host or any IP address), the -listAliases output is the following:</td>
</tr>
<tr>
<td></td>
<td>Aliases for SCVMM1:</td>
</tr>
<tr>
<td></td>
<td>HOST = *</td>
</tr>
</tbody>
</table>

Further assistance is available:

See "Troubleshooting master server communication failures in the NetBackup Add-in for SCVMM" on page 52.

Revoking an authorization token

You can delete or revoke an authentication token, as follows.
To revoke the authorization token

- Enter the following on the master server:

  Windows

  \install_path\NetBackup\wmc\bin\install\manageClientCerts.bat
  -delete clientName

  UNIX, Linux

  /usr/openv/wmc/bin/install/manageClientCerts -delete clientName

  Where clientName is the DNS name of the SCVMM console host where the add-in is installed.

  The -delete option removes the authentication token and its compressed file from the master server. The add-in is no longer authorized to restore virtual machines from the backups that this master server made.

Renewing an authorization token

You can renew an authentication token that has expired, as follows.

---

**Note:** Authentication tokens expire after one year.
To renew an authentication token

1. Enter the following on the master server:

   Windows
   
   \$install_path\NetBackup\wmc\bin\install\manageClientCerts.bat -renew clientName
   
   UNIX, Linux
   
   /usr/openv/wmc/bin/install/manageClientCerts -renew clientName
   
   Where clientName is the DNS name of the SCVMM console host where the add-in is installed.

   The -renew option deletes the token and creates a new one. Any aliases that existed for the token are retained.

   See “Listing all current authorization tokens” on page 32.

   See “Adding or deleting an additional host name or IP address for an authentication token” on page 27.

2. Use the plug-in’s Register Master Servers option to re-register the master server using the renewed authentication token.

   See “Authorizing the NetBackup add-in to restore virtual machines” on page 23.

Listing all current authorization tokens

You can list all the current authentication tokens that were generated on the current master server.

To list all current authorization tokens

Enter the following on the master server:

   Windows
   
   \$install_path\NetBackup\wmc\bin\install\manageClientCerts.bat -list
   
   UNIX, Linux
   
   /usr/openv/wmc/bin/install/manageClientCerts -list
   
   Sample output:

   Client Expiry Date
   
   SCVMM_console_host_1 Thu Feb 06 16:16:51 GMT+05:30 2016
   SCVMM_console_host_2 Fri Feb 07 11:22:53 GMT+05:30 2016
The command lists the SCVMM console hosts for which the tokens were created as well as their expiration dates. It can help diagnose communication problems between the SCVMM console host and the master server when a certificate has expired.

- For well-formatted output, set the command prompt or shell screen size to more than 100 units.

- Server names that are longer than 40 characters are truncated: Characters beyond the first 40 are replaced with “...”.

Installing the NetBackup Add-in for SCVMM

Configuring the NetBackup Recovery Wizard
Recovering virtual machines

This chapter includes the following topics:

■ Notes on restoring Hyper-V virtual machines with the Recovery Wizard
■ Accessing the Recovery Wizard
■ Restore Virtual Machine Wizard screens
■ Checking the status of a recovery job

Notes on restoring Hyper-V virtual machines with the Recovery Wizard

Use the NetBackup Recovery Wizard in the SCVMM console to restore a virtual machine from its NetBackup image.

Note the following about the NetBackup Add-in Recovery Wizard:

■ The NetBackup Recovery Wizard is for restore of an entire virtual machine, not for restore of individual files. To restore individual files from the virtual machine backup, use the NetBackup Backup, Archive, and Restore interface. See the topics on restoring individual files in the NetBackup for Hyper-V Administrator’s Guide.

■ The NetBackup Recovery Wizard does not support restore to a staging location. To restore the virtual machine to a staging location, use the NetBackup Backup, Archive, and Restore interface.

■ Changes that are made through Hyper-V Manager on individual Hyper-V hosts or clusters can take up to 24 hours to be reflected in the SCVMM Console. Until then, the NetBackup add-in Recovery Wizard may not have the latest virtual
machine configuration state. In that case, the Recovery Wizard's pre-recovery checks related to the VM's location may not be based on the most recent data in SCVMM. You may have to make a different selection in the Recovery Wizard. See “The pre-recovery checks in the Recovery Wizard of the NetBackup Add-in for SCVMM return out-of-date information about the VM” on page 50.

- The NetBackup Administration Console includes the following enhancements for restoring a VM:
  - A new VM GUID is generated by default when you restore a VM to an alternate location.
  - A new VM display name can be specified when you restore a VM.

---

**Note:** The NetBackup Recovery Wizard does not support these restore enhancements. Use the NetBackup Administration Console or the nbrestorevm command to generate a new GUID or set a new display name when restoring a VM.

---

- For the pre-requisites for using the Recovery Wizard:
  See “Configuring the NetBackup Recovery Wizard” on page 20.

### Accessing the Recovery Wizard

In the SCVMM console, you can launch the Recovery Wizard from the NetBackup add-in as described in this topic.

---

**Note:** To have access to the add-in, you must install it yourself. If you did not install it, the NetBackup option does not appear in the SCVMM ribbon.

---

**To access the Recovery Wizard**

1. In the SCVMM console, open the **VMs and Services** workspace.
2. Click **All Hosts**.
3 In the SCVMM ribbon, click the **NetBackup** option.

The first time you use the NetBackup add-in, an End User License Agreement (EULA) appears. To use the add-in, you must accept the EULA.

The components of the NetBackup add-in appear.

4 Click the **Recovery Wizard**.

The Virtual Machine Selection screen appears.

See “Virtual Machine Selection screen” on page 36.

**Restore Virtual Machine Wizard screens**

Use the following screens in the NetBackup add-in to restore a Hyper-V virtual machine.

**Virtual Machine Selection screen**

Use this screen to specify the virtual machine to restore.
Figure 3-1 Virtual Machine Selection screen in the NetBackup Recovery Wizard for SCVMM

Table 3-1 Fields in the Virtual Machine Selection screen of the NetBackup Recovery Wizard

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
</table>
| Master Server | Use the drop-down list to select the master server that made the backup.  
If the master server is not in the drop-down, you must add the server to the master server list.  
See "Authorizing the NetBackup add-in to restore virtual machines" on page 23. |
| VM Identifier | Enter the display name, host name, or GUID of the virtual machine that you want to restore.  
**Note:** This field is not case-sensitive.                                      |
| Next         | When you are done, click **Next** to go to the next screen of the wizard. |

</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If changes to the VM were recently made through Hyper-V Manager (not through SCVMM), the pre-recovery checks may encounter out-of-date information about the VM.</td>
</tr>
<tr>
<td></td>
<td>See “The pre-recovery checks in the Recovery Wizard of the NetBackup Add-in for SCVMM return out-of-date information about the VM” on page 50.</td>
</tr>
</tbody>
</table>

### Checking the status of a recovery job

You can check the status of a recovery job that is in progress and view the history of all recovery jobs.
To check the status of a recovery job

1. In the SCVMM console, open the Jobs workspace.
2. For the jobs that are in progress, click Running.

The Status column shows the job’s percent completion.

3. For a listing of recent jobs and past jobs, click History.

For all jobs not in progress, the Status column reads Completed or Failed.

If the NetBackup master server is disconnected or goes down during the recovery, the Status column is updated to:

Failed – Lost connection with NetBackup Master Server.

Note: You can reorder the listing by clicking on a column header.
Note: The **Restart** and **Cancel** buttons are not supported and are grayed out.
Troubleshooting

This chapter includes the following topics:

■ About logging for the NetBackup Add-in for SCVMM
■ Viewing log messages for the NetBackup Add-in for SCVMM
■ Changing the logging level for the NetBackup Add-in for SCVMM
■ The pre-recovery checks in the Recovery Wizard of the NetBackup Add-in for SCVMM return out-of-date information about the VM
■ Next button in the NetBackup Add-in Recovery Wizard is enabled even though required input has not been entered
■ The NetBackup Add-in Recovery Wizard does not prompt to overwrite the VM, and the recovery fails
■ Troubleshooting master server communication failures in the NetBackup Add-in for SCVMM

About logging for the NetBackup Add-in for SCVMM

The NetBackup Add-in for SCVMM records log messages about the following activities:

■ Restoring VMs by means of the NetBackup add-in.
■ Adding or removing NetBackup master servers from the NetBackup add-in.
### Table 4-1  Logging for NetBackup Add-in for SCVMM

<table>
<thead>
<tr>
<th>Logging details</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log message format</td>
<td>*yyyy-mm-dd hh:mm:ss,ms [pid] message</td>
</tr>
<tr>
<td>Logging levels</td>
<td>Several logging levels (verbosity) are available:</td>
</tr>
<tr>
<td></td>
<td>See “Changing the logging level for the NetBackup Add-in for SCVMM” on page 49.</td>
</tr>
<tr>
<td>Log location</td>
<td>The log location depends on where SCVMM is installed and who is logged on.</td>
</tr>
<tr>
<td></td>
<td>The following is an example log location for user JDoe:</td>
</tr>
<tr>
<td></td>
<td>C:\Program Files\Microsoft System Center 2012 R2\Virtual Machine Manager\Bin\AddInPipeline\AddIns\JDOe\SymcNBUAddIn \Logs</td>
</tr>
<tr>
<td></td>
<td>See “Viewing log messages for the NetBackup Add-in for SCVMM ” on page 47.</td>
</tr>
<tr>
<td>Log retention period</td>
<td>All log messages are written to the same log file in a 24-hour period. Each log file is retained for 7 days and then is automatically deleted.</td>
</tr>
</tbody>
</table>

## Viewing log messages for the NetBackup Add-in for SCVMM

**Note:** Log files are retained for 7 days and then are automatically deleted.

**Note:** If no log-related activity occurs in the NetBackup add-in during a 24-hour period, no log file is created.

To view the NetBackup Add-in for SCVMM log messages

1. In the SCVMM console, open the **VMs and Services** workspace.
2. Click **All Hosts**.
3. In the SCVMM ribbon, click the **NetBackup** option.
4 Click **Settings**.

5 Click **View Logs**.

The log files are shown as follows:

---

**Note:** The logs are written to the directory where you installed the NetBackup add-in.
6 Double-click on a log file.

The log file opens as follows:

![Log file screenshot]

7 When you are finished, close the Logs window and click Cancel.

### Changing the logging level for the NetBackup Add-in for SCVMM

To change the logging level

1 In the SCVMM console, open the VMs and Services workspace.
2 Click All Hosts.
3 Click the NetBackup option in the SCVMM console ribbon.
4 Click Settings.
5 Use the Set Log Level pull-down to select a different level.

By default, logging is set to the minimum level of detail (Error level). The following levels are available:

- **Error**  The default level.
- **Warning** Includes the error messages.
- **Information** Includes the warning and the error messages.
- **Debug** Includes the information, warning, and error messages - the highest level of detail.

6 Click Save.

The pre-recovery checks in the Recovery Wizard of the NetBackup Add-in for SCVMM return out-of-date information about the VM

When you click Recover on the Review Settings screen of the Recovery Wizard, the wizard runs pre-recovery checks to validate your selections and the recovery destination. However, if changes to the VM were recently made through Hyper-V Manager (not through SCVMM), the pre-recovery checks may encounter out-of-date information about the VM. Changes that are made through Hyper-V Manager on individual Hyper-V hosts or clusters can take up to 24 hours to be reflected in SCVMM. This delay is due to the Microsoft SCVMM refresh cycle, which the NetBackup add-in does not control.

For example: If the VM was recently deleted through the Hyper-V Manager, the deletion may not be reflected yet in SCVMM. In this case, the add-in's pre-recovery checks report that the VM still exists. The following message appears:
A virtual machine with the same identity exists on <host> and the overwrite option was not selected. Please review restore options and select overwrite to continue.

To recover the VM, go back to the wizard’s Restore Options screen and select Overwrite existing virtual machine, and rerun the recovery.

**Note:** In an SCVMM environment, Microsoft recommends making VM configuration changes through SCVMM (not through the Hyper-V Manager on individual hosts or clusters). Changes that are made through the SCVMM Console are reflected immediately in SCVMM. The add-in’s pre-recovery checks therefore reflect the current state of the VM.

---

**Next button in the NetBackup Add-in Recovery Wizard is enabled even though required input has not been entered**

In the Recovery Wizard of the NetBackup Add-in for SCVMM, the **Next** button is enabled even if some required input has not been entered. In the following case, the Recovery Wizard of the NetBackup Add-in for SCVMM enables the **Next** button prematurely:

- On the Add-in’s Manage Master Servers screen, an authentication token was added for an invalid master server. For example: The token was generated for an existing master server, but the server name was entered incorrectly on the Manage Master Servers screen.

- A second master server and its authentication token are added, and the master server’s name is entered correctly.

When you select the second master server in the wizard’s Virtual Machine Selection screen, you can click **Next** without selecting a VM identifier. The wizard lets you progress from screen to screen without completing the input for each screen. If you continue without making the required input, the Recovery button on the wizard’s last screen is grayed out.

**Note:** The wizard’s **Next** button should remain grayed out until the input for each screen is completed. To run the restore, go back through the wizard and make the required entries. You should also delete the invalid master server.
The NetBackup Add-in Recovery Wizard does not prompt to overwrite the VM, and the recovery fails

The NetBackup Add-in for Microsoft SCVMM Console does not complete a VM recovery in the following situation:

- On the **Virtual Machine Selection** screen of the **Add-in Recovery Wizard**, the VM is identified by its GUID or host name (not its display name).

- On the **Restore Options** screen of the wizard, the **Overwrite existing virtual machine** option is not selected.

- The same VM exists at the recovery destination.

When you click **Recover**, the wizard should detect the VM at the recovery destination and then prompt you to select the overwrite option. However, the prompt does not appear; the recovery job starts but then fails with status 2821.

To recover the VM, select **Overwrite existing virtual machine** on the **Restore Options** screen and rerun the recovery.

Troubleshooting master server communication failures in the NetBackup Add-in for SCVMM

To recover VMs, the add-in must have a registered NetBackup master server with a valid and correct authentication token. The NetBackup administrator generates the authentication token on a specific NetBackup master server for a specific SCVMM console host. The token gives the SCVMM console host access to the NetBackup master server where the token was generated. (Note: you can validate authentication tokens for currently registered master servers by means of the **Manage Master Servers** option in the add-in.)

If the TCP/IP address or host name of the SCVMM console host does not exactly match the information in the authentication token, the following operations fail: the Manage Master Servers operation, and VM recovery. Error messages such as the following may appear:

**Unable to connect the Netbackup Master Server. Do you want to add this master server?**

**Authentication failed. Please verify that the master server token is valid and correct using the 'Manage Master Servers' dialog box**

To correctly determine the problem and the corrective action, you must review the VxUL log file. On the master server, enter the following command:

```
vxlogview -i nbwebservice -p nb -L -E
```
Error example 1

The log file includes messages similar to the following:

02/17/2017 10:03:37.831 [Error] Remote host name does not match the name in the certificate, remote name:scvmm02.domain.com, name from certificate:scvmm02

In the log snip shown, the name in the token is scvmm02 and the required name is scvmm02.domain.com.

Veritas recommends that you revoke the existing token, generate a new token with the required name, and use the new token on the SCVMM console host. If you cannot do that, add the SCVMM console host's fully qualified domain name as an alias for the existing token, as follows:

manageClientCerts -addAlias scvmm02 -HOST scvmm02.domain.com

As an alternative, you can use the -ANY option:

manageClientCerts -addAlias scvmm02 -ANY

-ANY allows any host or any IP address to communicate with the NetBackup server by means of this token.

Caution: The -ANY option is not a secure method for restores. Please see the NetBackup Commands Reference Guide for more information on the manageClientCerts command.

Error example 2

The log file includes messages similar to the following:

02/17/2017 16:18:13.951 [Error] Remote host name does not match the name in the certificate, remote name:10.10.10.11, name from certificate:scvmm02

In the log snip shown, the name in the token is scvmm02 and the required name is 10.10.10.11.

Veritas recommends that you revoke the existing token, generate a new token with the required name, and use the new token on the SCVMM console host. If you cannot do that, add the SCVMM console host's TCP/IP address as an alias for the existing token, as follows:

manageClientCerts -addAlias scvmm02 -IP 10.10.10.11

As an alternative, you can use the -ANY option:
manageClientCerts -addAlias scvmm02 -ANY

-ANY allows any host or any IP address to communicate with the NetBackup server by means of this token.

Caution: The -ANY option is not a secure method for restores.

Additional information is available:

See “Adding or deleting an additional host name or IP address for an authentication token” on page 27.

See the manageClientCerts command in the NetBackup Commands Reference Guide.
