NetBackup™ Web UI Administrator’s Guide

Release 8.3
Technical Support

Technical Support maintains support centers globally. All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policies. For information about our support offerings and how to contact Technical Support, visit our website:

https://www.veritas.com/support

You can manage your Veritas account information at the following URL:

https://my.veritas.com

If you have questions regarding an existing support agreement, please email the support agreement administration team for your region as follows:

Worldwide (except Japan)        CustomerCare@veritas.com
Japan                           CustomerCare_Japan@veritas.com

Documentation

Make sure that you have the current version of the documentation. Each document displays the date of the last update on page 2. The latest documentation is available on the Veritas website:

https://sort.veritas.com/documents

Documentation feedback

Your feedback is important to us. Suggest improvements or report errors or omissions to the documentation. Include the document title, document version, chapter title, and section title of the text on which you are reporting. Send feedback to:

NB.docs@veritas.com

You can also see documentation information or ask a question on the Veritas community site:

http://www.veritas.com/community/

Veritas Services and Operations Readiness Tools (SORT)

Veritas Services and Operations Readiness Tools (SORT) is a website that provides information and tools to automate and simplify certain time-consuming administrative tasks. Depending on the product, SORT helps you prepare for installations and upgrades, identify risks in your datacenters, and improve operational efficiency. To see what services and tools SORT provides for your product, see the data sheet:

Chapter 1  Introducing the NetBackup web user interface  ........................................................................................................ 10
  About the NetBackup web UI ........................................................ 10
  Terminology ................................................................................ 12
  First-time sign in to a NetBackup master server from the NetBackup
  web UI ................................................................................ 14
  Sign in to the NetBackup web UI ................................................ 16
  Sign out of the NetBackup web UI ............................................. 17
  Authorized users ........................................................................ 17

Section 1  Managing security ............................................................................. 19

Chapter 2  Monitoring and notifications .......................................................... 20
  The NetBackup dashboard ................................................................ 20
  Monitoring jobs .......................................................................... 21
    Jobs: canceling, suspending, restarting, resuming, deleting .......... 22
    Filter jobs in the job list .......................................................... 22
  About notifications ...................................................................... 23
    Viewing notifications ............................................................. 24
    How to disable or modify NetBackup event notifications in the web
    UI ...................................................................................... 25
    About configuring automatic notification cleanup tasks ............ 30
  Send email notifications for job failures ........................................ 31
  Status codes that generate alerts ............................................... 33

Chapter 3  Managing role-based access control ........................................... 35
  About role-based access control (RBAC) in NetBackup .................. 35
  Configuring RBAC ...................................................................... 36
    Upgrading API key users to NetBackup 8.3 .............................. 37
    Add AD or LDAP domains ....................................................... 37
    Add an RBAC role .................................................................... 38
    Edit or remove a role ............................................................... 40
    View users in RBAC ............................................................... 41
    Add a user to a role ............................................................... 42
Display a banner to users when they sign in ........................................... 110

Chapter 7  Managing master server security settings  .............. 111

Certificate authority for secure communication ................................. 111
Disable communication with NetBackup 8.0 and earlier hosts ............. 112
Disable automatic mapping of NetBackup host names ......................... 112
About NetBackup certificate deployment security levels ..................... 113
Select a security level for NetBackup certificate deployment ............... 115
Set a passphrase for disaster recovery .............................................. 116
About trusted master servers .......................................................... 116
   Add a trusted master server ........................................................ 117
   Remove a trusted master server .................................................. 118

Chapter 8  Creating and using API keys ...................................... 119

About API keys ............................................................................... 119
Manage API keys ........................................................................... 119
Use an API key with NetBackup REST APIs .................................. 121
View API keys .............................................................................. 121

Chapter 9  Configuring authentication options .............................. 122

Sign-in options for the NetBackup web UI ........................................ 122
Configure user authentication with smart cards or digital certificates...
   Edit the configuration for smart card authentication ...................... 123
   Add or delete a CA certificate that is used for smart card authentication .............................................. 124
   Disable or temporarily disable smart card authentication .............. 125
About Single Sign-On (SSO) configuration ....................................... 126
Configure NetBackup for Single Sign-On (SSO) ................................ 128
   Configure the Java KeyStore ................................................... 130
   Add and enable the IDP configuration ........................................ 132
   Enroll the NetBackup master server with the IDP ....................... 133
   Manage an IDP configuration .................................................. 134
Troubleshooting SSO ................................................................... 137
   Redirection issues ................................................................... 137
   Unable to sign in due to authorization-related issues .................. 139

Chapter 10  Managing hosts ............................................................. 142

View NetBackup host information ....................................................... 142
Approve or add mappings for a host that has multiple host names
   .................................................................................................. 143
Chapter 11 Troubleshooting the web UI .............................................. 149

Tips for accessing the NetBackup web UI .............................................. 149
If a user doesn't have the correct permissions or access in the
NetBackup web UI ........................................................................ 151
Unable to add AD or LDAP domains with the vssat command .......... 151
  Connection cannot be established with the AD or the LDAP server
  ............................................................................................. 152
  User credentials are not valid .................................................. 153
  An incorrect user base DN or group base DN was provided .......... 154
  Multiple users or groups exist with the same name under user
  base DN or group base DN ............................................... 154
  User or group does not exist ................................................... 155
  Unable to validate the user or group .......................................... 156

Section 2 Managing storage and backups .............................................. 157

Chapter 12 Configuring storage .......................................................... 158

About storage configuration ........................................................... 158
Create a Media Server Deduplication Pool (MSDP) storage server
  .......................................................................................... 159
Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk
  storage server ........................................................................ 160
Create a disk pool ....................................................................... 162
Create a storage unit ................................................................... 164
Create a universal share .............................................................. 165
Using image sharing from the NetBackup Web UI ......................... 166
Troubleshooting storage configuration ............................................. 168
Troubleshooting universal share configuration issues ....................... 168

Chapter 13 Managing protection plans .................................................. 171

Create a protection plan ............................................................... 171
Edit or delete a protection plan ...................................................... 175
Subscribe an asset or an asset group to a protection plan ................. 176
Unsubscribe an asset from a protection plan .................................... 177
View protection plan overrides ..................................................... 178
About Backup Now ..................................................................... 178
About a NetBackup classic policy .................................................... 180
About policy management in the NetBackup web UI ....................... 181
Chapter 14 Managing protection plans for Microsoft SQL Server

About protecting SQL Server availability groups .................................. 182
Create a protection plan to protect SQL Server assets .................... 183
  Schedules and retention .......................................................... 186
  Performance tuning and configuration options ............................. 186
  Using copy-only snapshot backups to affect how differentials are based ................................................................. 189
  Snapshot methods ................................................................... 190
Protect a SQL Server availability group that crosses NetBackup domains ................................................................. 191

Chapter 15 Usage reporting and capacity licensing ......................... 194

Track backup data size on your master servers ................................. 194
Configure the servers list for usage reporting .................................. 195
Scheduling reports for capacity licensing ........................................ 196
Other configuration for incremental reporting .................................. 199
Troubleshooting failures for nbdeployutil and incremental reporting ................................................................. 201

Section 3 Veritas Resiliency Platform .............................................. 202

Chapter 16 Managing Resiliency Platforms ..................................... 203

About Resiliency Platform in NetBackup ........................................ 203
Understanding the terms .............................................................. 204
Configuring a Resiliency Platform ................................................. 205
  Add a Resiliency Platform ....................................................... 205
  Configuring a third-party CA certificate ..................................... 206
  Editing or deleting a Resiliency Platform ................................. 206
  Viewing the automated or not-automated VMs ............................ 207
Troubleshooting NetBackup and Resiliency Platform issues .......... 209

Section 4 Managing credentials ..................................................... 211

Chapter 17 Managing external KMS and workload credentials ......... 212

About credential management in NetBackup .................................. 212
Add a credential in NetBackup ................................................... 213
Edit a credential ........................................................................ 214

Introducing the NetBackup web user interface

This chapter includes the following topics:

- About the NetBackup web UI
- Terminology
- First-time sign in to a NetBackup master server from the NetBackup web UI
- Sign in to the NetBackup web UI
- Sign out of the NetBackup web UI
- Authorized users

About the NetBackup web UI

The NetBackup web user interface provides the following features:

- Ability to access the master server from a web browser, including Chrome and Firefox.
  For details on supported browsers for the web UI, see the NetBackup Software Compatibility List.
- A dashboard that displays a quick overview of the information that is important to you.
- Role-based access control (RBAC) that lets the administrator configure user access to NetBackup and to delegate the tasks such as security, backup management, or workload protection.
- Management of NetBackup security settings, certificates, API keys, and user sessions.
Protection of assets is achieved through protection plans, job management, and visibility of the protection status of assets. Alternatively, policy management is also available for a limited number of policy types.

Workload administrators can subscribe assets to the protection plans that meet the SLO, monitor protection status, and perform self-service recovery of virtual machines. The web UI supports the following workloads:

- Cloud
- Microsoft SQL Server
- Oracle
- Red Hat Virtualization (RHV)
- VMware

Usage reporting tracks the size of backup data on your master servers. You can also easily connect to Veritas Smart Meter to view and manage NetBackup licensing.

**Note:** The NetBackup web UI is best viewed at a 1280x1024 or higher screen resolution.

**Access control in the NetBackup web UI**

NetBackup uses role-based access control to grant access to the web UI. Access control is accomplished through roles.

- A role defines the operations that a user can perform and the access that the user has to any workload assets, protection plans, or credentials. A user can have multiple roles, allowing for full and flexible customization of user access.

- RBAC is only available for the web UI and the APIs. Other access control methods for NetBackup are not supported for the web UI and APIs, with the exception of Enhanced Auditing (EA). You cannot use the web UI if you have NetBackup Access Control (NBAC) enabled.

**Monitor NetBackup jobs and events**

The NetBackup web UI lets administrators more easily monitor NetBackup operations and events and identify any issues that need attention.

- The dashboard displays an overview of NetBackup jobs, certificates, tokens, security events, and usage reporting. The dashboard widgets that display depend on a user's RBAC role and permissions.
Email notifications can be configured so administrators receive notifications when job failures occur. NetBackup supports any ticketing system that can receive inbound email.

**Protection plans: One place to configure schedules, storage, and storage options**

Protection plans offer the following benefits:

- In addition to schedules for backups, a protection plan can also include a schedule for replication and long-term retention.
- When you select from your available storage, you can see any additional features available for that storage.
- With the necessary RBAC permissions, a workload administrator can create and manage protection plans, including the backup window and retention. See “Role permissions” on page 43.
- A workload administrator can select the protection plans to use to protect assets or intelligent groups.

**Self-service recovery**

The NetBackup web UI makes it easy for a workload administrator to recover VMs or databases. For the workloads that support the instant access feature, users can mount a snapshot for immediate access to a VM’s files or to a database.

**Terminology**

The following table describes the concepts and terms that are introduced with the new web user interface.

<table>
<thead>
<tr>
<th>Table 1-1</th>
<th>Web user interface terminology and concepts</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Term</strong></td>
<td><strong>Definition</strong></td>
</tr>
<tr>
<td>Administrator</td>
<td>A user that has complete access and permissions to NetBackup and all of the interfaces, including the NetBackup web UI. The root, administrator, and Enhanced Auditing user all have complete access to NetBackup. In the NetBackup Web UI guides, the term <em>NetBackup administrator</em> also refers to a user that has full permissions for NetBackup. Usually in reference to a user of the NetBackup Administration Console. Also see role.</td>
</tr>
<tr>
<td>Asset group</td>
<td>See intelligent group.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Asset</td>
<td>The data to be protected, such as physical clients, virtual machines, and database applications.</td>
</tr>
<tr>
<td>Backup now</td>
<td>An immediate backup of an asset. NetBackup performs a one-time, full backup of an asset using the selected protection plan. This backup does not affect any scheduled backups.</td>
</tr>
<tr>
<td>Classic policy</td>
<td>In the NetBackup web UI, indicates that a legacy policy protects the asset. Legacy policies are created with the NetBackup Administration Console.</td>
</tr>
<tr>
<td>External certificate</td>
<td>A security certificate that is issued from any CA other than NetBackup.</td>
</tr>
<tr>
<td>Intelligent group</td>
<td>Allows NetBackup to automatically select assets for protection based on the criteria (queries) that you specify. An intelligent group automatically stays up-to-date with changes in the production environment. These groups are also referred to as asset groups. For VMware and RHV, these groups appear under the tab Intelligent VM groups.</td>
</tr>
<tr>
<td>Instant access</td>
<td>An instant access VM or database that is created from a NetBackup backup image is available almost instantaneously, achieving a near-zero recovery time objective. NetBackup mounts the snapshot directly on the backup storage device and the snapshot is treated as a normal VM or database.</td>
</tr>
<tr>
<td>NetBackup certificate</td>
<td>A security certificate that is issued from the NetBackup CA.</td>
</tr>
<tr>
<td>Protection plan</td>
<td>A protection plan defines when backups are performed, how long the backups are retained, and the type of storage to use. Once a protection plan is set up, assets can be subscribed to the protection plan.</td>
</tr>
<tr>
<td>RBAC</td>
<td>Role-based access control. Administrators can delegate or limit access to the NetBackup web UI through the roles that are configured in RBAC.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>The roles that you configure in RBAC do not control access to the NetBackup Administration Console or the CLIs. The web UI is not supported with NetBackup Access Control (NBAC) and cannot be used if NBAC is enabled.</td>
</tr>
</tbody>
</table>
### Table 1-1  Web user interface terminology and concepts (continued)

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
<td>For RBAC, defines the operations that a user can perform and the assets or objects that they can access. For example, you can configure a role to manage recovery of specific databases and the credentials that are needed for backups and restores.</td>
</tr>
<tr>
<td>Storage</td>
<td>The storage to which the data is backed up, replicated, or duplicated (for long-term retention).</td>
</tr>
<tr>
<td>Subscribe, to a protection plan</td>
<td>The action of selecting an asset or an asset group to subscribe to a protection plan. The asset is then protected according to the schedule in the plan. The web UI also refers to Subscribe as Add protection.</td>
</tr>
<tr>
<td>Unsubscribe, from a protection plan</td>
<td>Unsubscribe refers to the action of removing protection or removing an asset or asset group from a plan.</td>
</tr>
<tr>
<td>Workload</td>
<td>The type of asset. For example, VMware, RHV, or Cloud.</td>
</tr>
<tr>
<td>Workflow</td>
<td>An end-to-end process that can be completed using the NetBackup web UI. For example, you can protect and recover VMware and Cloud assets beginning with NetBackup 8.1.2.</td>
</tr>
</tbody>
</table>

## First-time sign in to a NetBackup master server from the NetBackup web UI

After the installation of NetBackup, an administrator must sign into the NetBackup web UI from a web browser and create RBAC roles for users. A role gives a user permissions and access to the NetBackup environment through the web UI, based on the user’s role in your organization. Some users have access to the web UI by default.

See “Authorized users” on page 17.
To sign in to a NetBackup master server using the NetBackup web UI

1. Open a web browser and go to the following URL.
   https://masterserver/webui/login
   
   The *masterserver* is the host name or IP address of the NetBackup master server that you want to sign in to.

   If you are not able to access the web UI, refer to Support and additional configuration.

2. Enter the administrator credentials and click **Sign in**.

   - **For this type of user**
     - Local user: *username* (e.g., jane_doe)
     - Windows user: *DOMAIN\username* (e.g., WINDOWS\jane_doe)
     - UNIX user: *username@domain* (e.g., john_doe@unix)

3. On the left, select **Security > RBAC**.

4. You can give users access to the NetBackup web UI in one of the following ways:
   - Create roles for all users that require access to NetBackup.
   - Delegate the task of creating roles to another user.
     Create a role that has permissions to add RBAC roles. This user can then create roles for all users that require access to the NetBackup web UI.

     See “Configuring RBAC” on page 36.

     Root or administrator access is no longer needed for the web UI once you have delegated one or more users with permissions to create RBAC roles.

**Support and additional configuration**

Refer to the following information for help with accessing the web UI.

- Ensure that you are an authorized user.
  See “Authorized users” on page 17.

- For details on supported browsers for the web UI, see the **NetBackup Software Compatibility List**.

- If port 443 is blocked or in use, you can configure and use a custom port.

- If you want to use an external certificate with the web browser, see the instructions for configuring an external certificate for the web server.
See other tips for accessing the web UI.

Sign in to the NetBackup web UI

Authorized users can sign in to a NetBackup master server from a web browser, using the NetBackup web UI. The following sign-in options are available:

- Sign in with a user name and password
- Sign in with a certificate or smart card
- Sign in with single sign-on (SSO)

Sign in with a user name and password

Only authorized users can sign in to NetBackup web UI. Contact your NetBackup security administrator for more information.

To sign in to a NetBackup master server using a user name and password

1. Open a web browser and go to the following URL.
   https://masterserver/webui/login
   The masterserver is the host name or IP address of the NetBackup master server that you want to sign in to.

2. Enter your credentials and click Sign in.
   For example:

<table>
<thead>
<tr>
<th>For this type of user</th>
<th>Use this format</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local user</td>
<td>username</td>
<td>jane_doe</td>
</tr>
<tr>
<td>Windows user</td>
<td>DOMAINUsername</td>
<td>WINDOWS\jane_doe</td>
</tr>
<tr>
<td>UNIX user</td>
<td>username@domain</td>
<td>john_doe@unix</td>
</tr>
</tbody>
</table>

Sign in with a certificate or smart card

You can sign in to NetBackup web UI with a smart card or digital certificate if you are an authorized user. Contact your NetBackup security administrator for more information.

To use a digital certificate that is not on a smart card, you must first upload the certificate to the browser’s certificate manager. See the browser documentation for instructions or contact your certificate administrator for more information.
To sign in with a certificate or smart card
1. Open a web browser and go to the following URL.
   https://masterserver/webui/login
   The masterserver is the host name or IP address of the NetBackup master server that you want to sign in to.
2. Click Sign in with certificate or smart card.
3. When your browser prompts you, select the certificate.

Sign in with single sign-on (SSO)
You can sign in to NetBackup web UI with the single sign-on (SSO) option if SAML is configured as an identity provider in your NetBackup environment. Contact your NetBackup security administrator for more information.

To sign in to a NetBackup master server using SSO
1. Open a web browser and go to the following URL.
   https://masterserver/webui/login
   The masterserver is the host name or IP address of the NetBackup master server that you want to sign in to.
2. Click Sign in with single sign-on.
3. Follow the steps as provided by your administrator.
   On subsequent logons, NetBackup signs you in automatically to the master server.

Sign out of the NetBackup web UI
Note that NetBackup automatically signs you out of the web UI after 24 hours, which is the maximum time that is allowed for a user session. After that time NetBackup requires that you sign in again. You can also sign out if you want to change the sign-in option that you want to use (username and password, smart card, or single sign-on (SSO)).

To sign out of the NetBackup web UI
◆ On the top right, click the profile icon and click Sign out.

Authorized users
The following users are authorized to sign in to and use the NetBackup web UI.
### Table 1-2: Users that are authorized to use the NetBackup web UI

<table>
<thead>
<tr>
<th>User</th>
<th>Access</th>
</tr>
</thead>
<tbody>
<tr>
<td>Root, administrator, and Enhanced Auditing users</td>
<td>Full</td>
</tr>
<tr>
<td><strong>nbasedadmin</strong> Appliance user</td>
<td>NetBackup security administrator role, can grant access to other appliance users</td>
</tr>
<tr>
<td><strong>appadmin</strong> Flex Appliance user</td>
<td><strong>Note:</strong> The default admin user for the NetBackup appliance does not have access to the web UI.</td>
</tr>
<tr>
<td>User that has an RBAC role that gives access to the web UI</td>
<td>Varies See “Configuring RBAC” on page 36.</td>
</tr>
</tbody>
</table>
Managing security

- Chapter 2. Monitoring and notifications
- Chapter 3. Managing role-based access control
- Chapter 4. Security events and audit logs
- Chapter 5. Managing security certificates
- Chapter 6. Managing user sessions
- Chapter 7. Managing master server security settings
- Chapter 8. Creating and using API keys
- Chapter 9. Configuring authentication options
- Chapter 10. Managing hosts
- Chapter 11. Troubleshooting the web UI
Monitoring and notifications

This chapter includes the following topics:

- The NetBackup dashboard
- Monitoring jobs
- About notifications
- Send email notifications for job failures

The NetBackup dashboard

The NetBackup dashboard provides a quick view of the details that are related to your role in your organization.

Table 2-1  The NetBackup dashboard for the NetBackup security administrator

<table>
<thead>
<tr>
<th>Dashboard widget</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Jobs</td>
<td>Lists job information, including the number of active and queued jobs and the status of attempted and completed jobs.</td>
</tr>
</tbody>
</table>
Table 2-1  The NetBackup dashboard for the NetBackup security administrator (continued)

<table>
<thead>
<tr>
<th>Dashboard widget</th>
<th>Description</th>
</tr>
</thead>
</table>
| Certificates     | Displays the information about the NetBackup host ID-based security certificates or the external certificates in your environment. For external certificates, the following information is shown for NetBackup 8.2 and later hosts:  
  ■ Total hosts. The total number hosts. The hosts must be online and able to communicate with NetBackup master server.  
  ■ Missing. The number hosts that do not have an external certificate enrolled.  
  ■ Valid. The number of hosts that have an external certificate enrolled.  
  ■ Expired. The number of hosts with expired external certificates. More details are available in Certificates > External certificates. See “About security management and certificates in NetBackup” on page 98. |
| Tokens           | Displays the information about the authorization tokens in your environment. |
| Security events  | The Access history view includes a record of logon events. The Audit events view includes the events that users initiate on the NetBackup master server. |
| Usage reporting  | Lists the size of the backup data for the NetBackup master servers in your organization. This reporting is useful to track capacity licensing. Use the drop-down lists in the top right to select the time period and the view that you want to display. Click on a server name to see specific details for that server. Additional details are available for how to configure NetBackup to display master server information in this widget. See “Track backup data size on your master servers” on page 194. |

Monitoring jobs

Use the Jobs node to monitor the jobs in your NetBackup environment and view the details for a specific job.

To monitor a job

1  Click Jobs and select the job name or check the box of the job that you want to view. You can select the checkbox for a job to perform a particular action on that job, such as restarting the job. Under Status, click the status code to view the status code message.

  ■ Select the Overview tab to view information about a job. The tab displays the File List and Status. The File List contains the files that are included
in the backup image. Under **Status**, click the status code number to view information about this status code in the Veritas Knowledge Base. See the **NetBackup Status Codes Reference Guide**.

- Select the **Details** tab to view the logged details about a job. You can filter the logs by error type using the drop-down menu.

2 From here, you can perform additional tasks.

See “Jobs: canceling, suspending, restarting, resuming, deleting” on page 22.

**Jobs: canceling, suspending, restarting, resuming, deleting**

To manage jobs

1 Click **Jobs**.
2 Select one or more jobs.
3 The top menu shows the actions that you are able to perform for the selected jobs.

- **Cancel** You can cancel the jobs that have not yet completed. They can be in one of the following states: queued, re-queued, active, incomplete, or suspended.
  
  When a parent job is canceled, any child jobs are also canceled.

- **Suspend** You can suspend backup and restore jobs that contain checkpoints.

- **Restart** You can restart the jobs that have completed, failed, or that have been canceled or suspended.
  
  A new job ID is created for the new job.

- **Resume** You can resume the jobs that have been suspended or are in an incomplete state.

- **Delete** You can delete the jobs that have completed. When a parent job is deleted, any child jobs are also deleted.

Filter jobs in the job list

You can filter the jobs to display the jobs in a specific state. For example, you can display all of the active jobs or all of the suspended jobs.
To filter the job list

1. Click Jobs.
2. Above the job list, click the Filter option.
3. In the Filter window, select a filter option to dynamically change the jobs that are displayed. The filter options are as follows:
   - All
   - Active
   - Done
   - Failed
   - Incomplete
   - Partially Successful
   - Queued
   - Successful
   - Suspended
   - Waiting for Retry
4. Click Apply Filters.
5. To remove the selected filters, click Clear All.

About notifications

To make NetBackup administrators aware of important system events, NetBackup regularly queries system logs and displays notifications about the events.

Note: Job events are not included with these notifications. See job details in the Activity Monitor for information about job events.

A Notifications icon is located at the top right in the web UI. You can click the icon to open the Notifications window and view a list of critical notifications 10 at a time. If a number is displayed with the icon, it indicates how many unseen critical messages exist. After you have opened the window, the number is reset.

From the window, you can choose to see a more comprehensive list of all notifications. Each event has a category for its NetBackup or external component and is assigned a severity level:
   - Error
You can sort, filter, and search the list. The comprehensive list also lets you review details about each event. The details include the full description as well as any appropriate extended attributes.

NetBackup notifications are not available if the NetBackup Messaging Broker (nbmqbroker) is not running. See the *NetBackup Troubleshooting Guide* for information about restarting the service.

For more information about notifications:

See *Viewing notifications* on page xxx.

See *How to disable or modify NetBackup event notifications in the web UI* on page xxx.

See *About configuring automatic notification cleanup tasks* on page xxx.

**Viewing notifications**

**To view notifications**

1. At the top right, click the **Notifications** icon to view a list of critical notifications 10 at a time.

   __Note:__ If a number is displayed with the icon, it indicates how many unseen critical messages exist. After you have opened the **Notifications** window, the number is reset.

   Click **Load 10 more** to view the next 10 notifications. After you have viewed 30 notifications, click **Show all** to view any remaining messages.

   Use **Refresh** to load the most recent notifications again.

2. To view all notifications, click **Show all** to open the **Notifications** page. On the page, you can do the following:

   - Click a notification to view its details. The details include the full description as well as extended attributes.
   - To sort the list, click any of the column headings except **Description**. Notifications are sorted by default by the date received.
To filter notifications, click the Filter icon at the top right. You can filter by Severity and Timeframe. In the Filter window, select the parameter values you want to filter by, and then click Apply filters. To remove all filters, click Clear all.

To search for notifications, enter the search string in the Search... field. You can search for values in all columns except Description and Received.

How to disable or modify NetBackup event notifications in the web UI

You can disable specific types of NetBackup event notifications that appear in the web UI, or modify their severity and priority, by making changes to the eventlog.properties file on the NetBackup master server:

- Windows:
  \install_path\var\global\wmc\h2Stores\notifications\properties

- UNIX:
  /usr/openv/var/global/wmc/h2Stores/notifications/properties

To disable event notifications

- Add a DISABLE entry in the eventlog.properties file in one of the following formats:
  
  DISABLE.NotificationType = true

  Or  DISABLE.NotificationType.Action = true

  Or  DISABLE.namespace

  See Table 2-2 for valid NotificationType and Action values.

For example:

- To disable notifications about all storage unit events:
  
  DISABLE.StorageUnit = true

- To disable only notifications about create storage unit events:
  
  DISABLE.StorageUnit.CREATE = true

- To disable only notifications about update to storage unit events using a namespace:
  
  DISABLE.eventlog.vrts.nbu.emm.storageunit.update = true
To modify the priority or severity of event notifications

- Add or change an entry in the `eventlog.properties` file in one of the following formats:

  \[\text{NotificationType.Action.priority} = \text{value}\]

  Or \[\text{NotificationType.Action.severity} = \text{value}\]

Valid **priority** values are: LOW, MEDIUM, HIGH

Valid **severity** values are: CRITICAL, ERROR, WARNING, INFO, DEBUG

For example:

- To set priority and severity for create storage unit events:

  ```
  StorageUnit.CREATE.priority = LOW
  StorageUnit.CREATE.severity = INFO
  ```

### Table 2-2

<table>
<thead>
<tr>
<th>Event type and notification type value</th>
<th>Action</th>
<th>Severity</th>
<th>Sample notification message</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy PolicyEvent</td>
<td>ADD</td>
<td>INFO</td>
<td>The policy event for <code>{Policy_Name}</code> was received. The policy <code>{Policy_Name}</code> was created.</td>
</tr>
<tr>
<td></td>
<td>DELETE</td>
<td>CRITICAL</td>
<td>The policy <code>{Policy_Name}</code> was deleted.</td>
</tr>
<tr>
<td>Client ClientEvent</td>
<td>ADD</td>
<td>INFO</td>
<td>The client <code>{Client_Name}</code> was created.</td>
</tr>
<tr>
<td></td>
<td>DELETE</td>
<td>CRITICAL</td>
<td>The client <code>{Client_Name}</code> was deleted.</td>
</tr>
<tr>

### About configuring automatic notification cleanup tasks

By default, NetBackup runs event notification cleanup tasks every 4 hours. Up to 10,000 event records are stored for up to 3 days in the event database. During the cleanup tasks, NetBackup removes the older notifications from the database.

You can change how often the cleanup tasks run, how many event records are kept at one time, and the number of days a record is retained.

From a command line, use `bpsetconfig` or `bpgetconfig` to change the parameter values listed in Table 2-3. See the NetBackup Command Reference Guide for more information about these commands.

You can also change the parameter values with the following APIs:

- GET/config/hosts/{hostId}/configurations
- POST/config/hosts/{hostId}/configurations
- GET/config/hosts/{hostId}/configurations/configurationName (for a specific property)
- PUT/config/hosts/{hostId}/configurations/configurationName
- DELETE/config/hosts/{hostId}/configurations/configurationName
See the *NetBackup 8.3 API Reference* on SORT for more information about these APIs.

### Table 2-3 Configurable parameters for automatic notification cleanup tasks

<table>
<thead>
<tr>

### Send email notifications for job failures

You can configure NetBackup to send email notifications when job failures occur. This way administrators spend less time monitoring NetBackup for job failures and manually creating tickets to track issues. NetBackup supports the ticketing systems that use inbound email service for ticket creation.

See "Status codes that generate alerts" on page 33.

NetBackup generates alerts based on certain job failure conditions or NetBackup status codes. Alerts that are similar or have a similar reason for failure are marked as duplicates. Email notifications for duplicate alerts are not sent for the next 24 hours. If a notification cannot be sent, NetBackup retries every 2 hours, up to three attempts.

NetBackup audits an event if changes are made to the alert settings or when it cannot generate an alert or send an email notification. See “About NetBackup auditing” on page 89.

### Prerequisites

Review the following requirements before you configure email notifications using a ticketing system.

- The ticketing system is up and running.
- The SMTP server is up and running.
A policy is configured in the ticketing system to create tickets (or incidents) based on the inbound emails that NetBackup sends.

To configure email notifications

1. At the top right, click **Settings > Email notifications**.
2. Go to the **Email notifications** tab.
3. Select **Send email notifications**.
4. Enter the email information including the recipient's email address, the sender's email address, and the email sender's name.
5. Enter the SMTP server details including the SMTP server name and port number.
   
   Provide the SMTP user name and password if you have specified the credentials earlier on the SMTP server.
6. Click **Save**.
7. Log on to the ticketing system to view the tickets that were created based on NetBackup alerts.

Exclude specific status codes from email notifications

You can exclude specific status codes so that email notifications are not sent for these errors.

To exclude specific status codes

1. At the top right, click **Settings > Email notifications**.
2. Locate **Exclude status codes**.
3. Enter the status codes or a range of status codes (separated by commas) for which you do not want to receive email notifications.
4. Click **Save**.

Sample email notification for an alert

An email notification for an alert contains information about master server, job, policy, schedule, and error. Emails may contain other information based on the type of job. For example, for VMware job failures, details such as vCenter Server and ESX host are present in the email notification.

Example email notification:

```
Master Server: master1.example.com

Client Name: client1.example.com

Job ID: 50
```
Job Start Time: 2018-05-17 14:43:52.0
Job End Time: 2018-05-17 15:01:27.0
Job Type: BACKUP
Parent Job ID: 49
Policy Name: Win_policy
Policy Type: WINDOWS_NT
Schedule Name: schedule1
Schedule Type: FULL
Status Code: 2074
Error Message: Disk volume is down

Status codes that generate alerts

The NetBackup web UI supports alerts for VMware job failures and retains the alerts for 90 days. NetBackup generates alerts for the supported status codes for following job types: backup, snapshot, snapshot replication, index from snapshot, and backup from snapshot. For the complete list of status codes for which alerts are generated, refer to the information for alert notification status codes in the NetBackup Status Codes Reference Guide.

Table 2-4 lists some of the conditions or status codes for which alerts are generated. These alerts are sent to the ticketing system through email notifications.

<table>
<thead>
<tr>
<th>Status code</th>
<th>Error message</th>
</tr>
</thead>
<tbody>
<tr>

Managing role-based access control

This chapter includes the following topics:

- About role-based access control (RBAC) in NetBackup
- Configuring RBAC
- Role permissions
- Manage access
- Configure an external certificate for the NetBackup web server

About role-based access control (RBAC) in NetBackup

The NetBackup web user interface provides the ability to apply role-based access control in your NetBackup environment. Use RBAC to provide access for the users that do not currently have access to NetBackup. Or, for current NetBackup users with administrator access you can provide limited access and permissions, based on their role in your organization.

For information on access control methods for the NetBackup Administration Console and access control and auditing information for root users and administrators, refer to the NetBackup Security and Encryption Guide.
### RBAC features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom roles allow users to perform specific tasks</td>
<td>Create custom roles to fit the role of your users. Root users and administrators still have full permissions in all NetBackup interfaces and in the APIs.</td>
</tr>
<tr>
<td>Users can access NetBackup areas and features that fit their role</td>
<td>RBAC users can perform common tasks for their business role, but are restricted from accessing other NetBackup areas and features. RBAC also controls the assets that users can view or manage.</td>
</tr>
<tr>
<td>Auditing of RBAC events</td>
<td>NetBackup audits RBAC events.</td>
</tr>
<tr>
<td>DR ready</td>
<td>RBAC settings are protected with the NetBackup catalog.</td>
</tr>
<tr>
<td>Enhanced Auditing or authorization (auth.conf) configurations still available for older interfaces</td>
<td>Enhanced Auditing is supported across all interfaces. You can continue to use the authorization (auth.conf) configurations with the NetBackup Administration Console and the CLIs. With these older interfaces you can manage access to workflows that are not yet supported in the NetBackup web UI and NetBackup APIs. Note that the auth.conf file does not restrict access to the NetBackup web UI or the NetBackup APIs. You cannot use the web UI if you have NetBackup Access Control (NBAC) enabled.</td>
</tr>
</tbody>
</table>

### Configuring RBAC

To configure role-based access control for the NetBackup web UI, perform the following steps.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Reassign NetBackup 8.2 users to new RBAC roles.</td>
<td>If you upgraded from NetBackup 8.2 to NetBackup 8.3, you need to create new roles for existing users and for API key users. See “Upgrading API key users to NetBackup 8.3” on page 37.</td>
</tr>
<tr>
<td>2</td>
<td>Configure any Active Directory or LDAP domains.</td>
<td>Before you can add domain users, Active Directory or LDAP domains must be authenticated with NetBackup. See “Add AD or LDAP domains” on page 37.</td>
</tr>
<tr>
<td>3</td>
<td>Determine the permissions that your users need.</td>
<td>Determine the permissions that your users need to perform their daily tasks. See “Role permissions” on page 43.</td>
</tr>
</tbody>
</table>
### Table 3-2
(continued)

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Configure the RBAC roles.</td>
<td>Create the roles that are needed.</td>
</tr>
</tbody>
</table>

## Upgrading API key users to NetBackup 8.3

Any existing API keys are preserved in the upgrade NetBackup 8.3. You do not need to regenerate your API keys. However, you must reassign the principals for those API keys to a role that has the necessary permissions for the operations that are used with those keys.

### To upgrade API key users for NetBackup 8.3

1. Open the NetBackup web UI and sign in as with the Administrator role.
2. On the left, select Security > API keys.
3. Note the User name for each API key.
4. On the left, select Security > RBAC.
5. Select one of the following options.
   - Add the user to the Administrator role.
     - Click on Administrators role and then on Users tab.
     - Enter one of the user names from step 3 and click Add to list.
   - Enter any additional users that you want to have this role.
   - Create a new role or roles with necessary access.
     - Click Add and enter the details for the new role.
     - Determine the permissions that the users need to use with their API keys.
     - Enter one of the user names from step 3 and click Add to list.
     - Enter any additional users that you want to have this role.
8. After the role is created, add any other roles that are needed for other API key users.

6. Terminate all active sessions for these users.
   - See “Sign out a NetBackup user session” on page 107.

## Add AD or LDAP domains

NetBackup RBAC in the NetBackup web UI supports domain users of Active Directory (AD) or Lightweight Directory Access Protocol (LDAP). Before you can
add access rules for domain users, you must add the AD or the LDAP domain. A domain also must be added before you can configure that domain for smart card authentication.

You can use the POST /security/domains/vxat API or the vssat command to configure domains.

To add an AD or an LDAP domain with the vssat command

1. Ensure that the user account (in the -m option) has the required rights to query the AD or the LDAP server.
2. Log on to the master server as root or administrator.
3. Run the following command.

   ```
vssat addldapdomain -d DomainName -s server_URL -u user_base_DN -g group_base_DN -t rfc2307 | msad -m admin_user_DN
   ```

   For example, to add an LDAP domain:

   ```
vssat addldapdomain -d nbudomain -s ldap://example.com -u "OU=Users,DC=example,DC=com" -g "OU=Groups,DC=example,DC=com" -m "CN=TestUser,OU=Users,DC=example,DC=com" -t msad
   ```

4. Verify that the specified AD or LDAP domain was successfully added.

   ```
vssat validateprpl
   ```

For more information on the vssat command and more of its options, see the NetBackup Command Reference Guide.

Add an RBAC role

An RBAC role defines the permissions that a NetBackup user has and the access that the user has to workload assets, protection plans, or credentials.

**Note:** You can only use the web UI to configure access to workloads, protection plans, and credentials when you create a role. After the role is created you must recreate the role or add an additional role that has the necessary permissions. Or, you can use the NetBackup APIs to update a role.

xref to sample roles/best practices
To add an RBAC role

1. On the left, select **Security > RBAC** and click **Add**.

2. Provide a **Role name** and a description.
   
   For example, you may want to indicate that role is for any users that are backup administrators for a particular department or region.

3. On the **Select permissions** card, click **Assign**.

   See “**Role permissions**” on page 43.

   The permissions that you select determine the other settings that you can configure for a role.

   - The **Select workloads** card is enabled when you select **Asset** permissions.
   - The **Select protection plans** card is enabled when you select **Protection plans** permissions.
   - The **Credentials** card is enabled when you select **Credentials** permissions.
4 View or manage NetBackup permissions for hosts, images, jobs, and specific NetBackup configuration settings.

View or manage NetBackup permissions for policies and storage lifecycle policies (SLPs).

View or manage NetBackup permissions for NetBackup security settings, including access control, certificate management, authentication, and encryption.

View or manage NetBackup permissions for storage.

View or manage workloads

View or manage protection plans

View or manage credentials

5 On the Select users card, click Assign.

6 When you are done configuring the role, click Save.

Edit or remove a role

You can edit or remove a role when you want to change or remove permissions for users with that role.

Note: Assets, Protection plans, and Credentials only can be edited when you add a role.
Edit a role

**Note:** When you change permissions for a role, the changes affect all users that are assigned to that role.

**To edit a role**

1. On the left, click **Security > RBAC**.
2. Click on the **Roles** tab.
3. Locate and click on the role that you want to edit.
   - To edit the role description, click **Edit description**.
   - The role name cannot be changed after you create the role.
   - To edit permissions for the role, click **Edit**.
   - To add or remove users for the role, click the **Users** tab.
     
     See “Add a user to a role” on page 42.
   - See “Remove a user from a role” on page 43.

Remove a role

**Note:** When you remove a role, any users that are assigned to that role lose the permissions that the role provided.

**To remove a role**

1. On the left, click **Security > RBAC**.
2. Click the **Roles** tab.
3. Locate the role that you want to remove and select the check box for it.
4. Click **Remove > Yes**.

View users in RBAC

You can view the users that have been added to RBAC and the roles that they are assigned to. The **Users** list is view-only. To edit the users that are assigned to a role, you must edit the role.
To view the users in RBAC

1. On the left, click **Security > RBAC**.
2. Click on the **Users** tab.
3. The **Roles** column indicates each role to which the user is assigned.

Add a user to a role

You can add a user to a role when want to give the permissions that role provides.

If a user is added to a role, the user must sign out and sign in again before the user’s permissions are updated.

**To add a user to a role**

1. On the left, click **Security > RBAC**.
2. Click the **Roles** tab.
3. Click on the role that you want to edit and click on the **Users** tab.
4. From the **Sign-in type** list, select the sign-in method you want the user to use.

   **Note:** The SAML options are only available if there is an IDP configuration available for NetBackup.

<table>
<thead>
<tr>
<th>User sign-in method</th>
<th>Select this sign-in type</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Sign in with user name and password</strong></td>
<td>Default sign-in or smart card</td>
</tr>
<tr>
<td>This option applies to local or to domain users or groups.</td>
<td></td>
</tr>
<tr>

<td>username@domain</td>
<td>john_doe@unix</td>
</tr>
<tr>
<td></td>
<td>groupname@domain</td>
<td>admins@unix</td>
</tr>
</tbody>
</table>

6 Click Add to list.

Remove a user from a role

You can remove a user from a role when you want to remove permissions for that user.

If a user is removed from a role, the user must sign out and sign in again before the user’s permissions are updated.

To remove a user from a role

1 On the left, click **Security > RBAC**.
2 Click the **Roles** tab.
3 Click on the role that you want to edit.
4 On the **Users** tab, select the user that you want to remove.
5 Click **Remove > Remove**.

Role permissions

Role permissions define the operations that roles users have permission to perform.
<table>
<thead>
<tr>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global</td>
<td>Global permissions apply to all assets or objects. For example, in NetBackup 8.3, <strong>Jobs</strong> or <strong>Hosts</strong> permissions cannot be applied to specific jobs or hosts. A role with <strong>Jobs</strong> or <strong>Hosts</strong> permissions apply to all jobs or hosts.</td>
</tr>
</tbody>
</table>

|                     | See “Credentials” on page 81.  
|                     | **Note:** Credentials can only be added when you create a role and cannot be added to an existing role.                                      |

**Notes for using NetBackup RBAC**

Note the following when you configure the permissions for RBAC roles:

- RBAC only controls access to the web UI and not the NetBackup Administration Console.
When you create roles, be sure to enable the minimal number of permissions so the user can sign in to and use the web UI. Some individual permissions do not have a direct correlation with a screen in the web UI. Users that attempt to sign in but that only have a permission of this kind receive an "Unauthorized" message.

If a user is added to or removed from a role, the user must sign out and sign in again before the user’s permissions are updated.

Most permissions are not implicit. In most cases a Create permission does not give a user View permission. A Recovery permission does not give a user View permission or other recovery options like Overwrite.

Not all RBAC-controlled operations can be used from the NetBackup web UI. (For example, NetBackup backup images can only be viewed and managed from the APIs or the NetBackup Administration Console.) These types of operations are included in RBAC so a role administrator can create roles for API users as well as web UI users.

Some tasks require a user to have permissions in multiple RBAC categories. For example, to establish a trust relationship with a remote master server, a user must have permissions for both Remote master servers and Trusted master servers.

Global > NetBackup management

Access hosts

An access host acts as a channel to establish an indirect communication between the NetBackup master server and the RHV manager or the VMware server. This host is the "backup host" during backups and the "recovery host" when it performs a restore.

Table 3-4  RBAC permissions for access hosts

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the access hosts that are configured for VMware or RHV.</td>
<td></td>
</tr>
<tr>
<td>Create</td>
<td>Add an access host for VMware or RHV.</td>
<td>View</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete an access host that is configured for VMware or RHV.</td>
<td>View</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
<td>View</td>
</tr>
</tbody>
</table>
Email notifications

These permissions allow a user to view and manage the settings for the email notifications that are created for use with a ticketing system. In the NetBackup web UI these settings are found in Settings > Email notifications. Configuration that is available in the NetBackup Administration Console for other notification types (backup administrator or host administrator) are not yet available for the NetBackup web UI.

Table 3-5 RBAC permissions for NetBackup email notifications

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the settings for email notifications for job failures.</td>
<td></td>
</tr>
<tr>
<td>Update</td>
<td>Update the settings for email notifications for job failures.</td>
<td>View</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
<td>View</td>
</tr>
</tbody>
</table>

Data classification

The data classification policy attribute specifies the classification of the policy that stores the backup. These levels can be created and edited from the NetBackup Administration Console in Host Properties > Data Classification.

Table 3-6 RBAC permissions for data classifications

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View and select the data classification level in the NetBackup policy attributes.</td>
<td>View</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
<td></td>
</tr>
</tbody>
</table>

Event logs

Permissions for event log messages allow users to view and manage message resource bundles from external services. Permissions for event log notifications allow users to view and manage NetBackup notifications.
**Event log messages**

Note: These operations are only available from the NetBackup APIs.

**Table 3-7**  
RBAC permissions for event log messages

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Create</td>
<td>Create event log notifications for external services. This operation is only available from the NetBackup APIs.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
</tr>
</tbody>
</table>

**NetBackup hosts**

Note: Though the Hosts settings appear under the Security node in the NetBackup web UI, giving a user all RBAC “Security” permissions does not give the user “Hosts” permissions.
The NetBackup Hosts permissions allow a user to view and manage hosts and host mappings.

Minimally the View permission is also required to enable the following settings and functionality in the NetBackup web UI: User sessions, Processes and Daemons in the Activity monitor, Jobs, notifications in the toolbar, and Auto discovery settings for RHV and VMware.

Table 3-9

**Resource limits**

Resource limits control the number of simultaneous backups that can be performed on a VMware or RHV resource type.

To view and manage resource limits, users must have permissions to view the workload and the workload assets. Those settings are only available when you create a role in the web UI or from the APIs.
Table 3-17  RBAC permissions for resource limits

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the resource limits that are configured for all workload types.</td>

</tr>
<tr>
<td>Manage access</td>
<td>See “Manage access” on page 82.</td>
<td>View</td>
</tr>
</tbody>
</table>

Retention levels

In a policy, the retention level determines how long NetBackup retains the backups or the archives that are created according to the schedule. This setting applies to the master server.

Note: These operations are only available when you create NetBackup policies. If you do not choose a specific level, the default level of 2 weeks is used.

Table 3-18  RBAC permissions for retention levels

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>

### WebSocket servers

These permissions manage the NetBackup WebSocket Service (NBWSS), which allows applications in the cloud to communicate with a NetBackup master server that is behind a firewall. NBWSS uses the WebSocket protocol to create a secure connection to the application's server in the cloud. On that connection, the application can interact with NetBackup by invoking REST APIs and can receive notifications from NetBackup.

The operations for WebSocket servers are only available from the NetBackup APIs and the NetBackup Administration Console.

### Table 3-25  
RBAC permissions for WebSocket servers

Global > Protection

Policies

Users that have protection permissions can view or perform operations on NetBackup policies with the web UI and APIs. Policy types are limited to MS-Windows, Standard, Oracle, and MS-SQL-Server.

**Note:** It is recommended that only users with the Administrator role manage policies. A user may not have sufficient permissions to perform all policy management operations unless the user is a member of the Administrator role.

Table 3-26  RBAC permissions for policies

<tr>
<td></td>
<td></td>
<td>NetBackup management &gt; NetBackup hosts &gt; Delete</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
<td></td>
</tr>
</tbody>
</table>

#### Certificate management

The certificate management permissions allow users to manage the NetBackup certificate authorities and certificates and to manage how NetBackup uses any external certificate authorities.

#### NetBackup certificate authority

The NetBackup certificate authority permissions allow users to manage the process of migrating the NetBackup Root CA to a higher key strength.

### Table 3-31 NetBackup certificate authority

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
</tr>
<tr>
<td>Migrate CA</td>
<td>View and migrate the NetBackup Root CA to 2048-bit key strength or higher.</td>
</tr>
<tr>
<td>View hosts migrate CA</td>
<td>View the NetBackup hosts that are not yet migrated (pending) to the 2048-bit key strength or higher NetBackup Root CA.</td>
</tr>
</tbody>
</table>
External certificates

The external certificates permissions allow users to manage how NetBackup uses certificates from an external certificate authority. Configuration for external certificates is only available from the NetBackup APIs. See the NetBackup Security APIs.

**Note:** To view external certificates in the NetBackup web UI, a user must have NetBackup certificates > View.

<table>
<thead>
<tr>
<th>Table 3-32</th>
<th>RBAC permissions for external certificates</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operation</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>Create</td>
<td>Associate the external certificate details with the host ID of the host.</td>
</tr>
<tr>
<td>Delete</td>
<td>Removes the association of the host ID to the external certificate.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
</tr>
<tr>
<td>Reset certificate</td>
<td>Resets the values of the external certificate except the subject. The certificate fields are populated again during certificate enrollment.</td>
</tr>
</tbody>
</table>

NetBackup certificates

NetBackup certificates permissions allow users to view and manage NetBackup security certificates. Note that permissions for NetBackup tokens are separate.

<table>
<thead>
<tr>
<th>Table 3-33</th>
<th>NetBackup certificates</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Operation</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>View</td>
<td>View the details of the NetBackup security certificates and view any external certificates that NetBackup hosts use.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
</tr>
<tr>
<td>Dissociate NetBackup security certificates</td>
<td>Dissociates the NetBackup host name from the certificate it is currently associated with.</td>
</tr>
<tr>
<td>Revoke</td>
<td>Revoke NetBackup security certificates.</td>
</tr>
</tbody>
</table>
NetBackup security tokens
Permissions for NetBackup security tokens allow users to view and manage NetBackup security tokens. Note that permissions for NetBackup certificates are separate.

Table 3-34 RBAC permissions for NetBackup security tokens

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>

<tr>
<td>Create</td>
<td>Create a NetBackup security token.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete a NetBackup security token or cleanup expired tokens.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See “Manage access” on page 82.</td>
</tr>
</tbody>
</table>

Disaster recovery passphrase
These permissions allow a user to view and manage the passphrase for NetBackup disaster recovery.

Table 3-35 RBAC permissions for the disaster recovery passphrase

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the Disaster recovery tab in the NetBackup web UI. View if the disaster recovery passphrase is set.</td>
</tr>
<tr>
<td>Create</td>
<td>Add or change the disaster recovery passphrase.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See “Manage access” on page 82.</td>
</tr>
</tbody>
</table>

Identity provider configuration
These permissions provide access control on NetBackup authentication service (VxAT) domains and on the identity provider configurations (Single Sign-On or SSO authentication using a SAML server).
**Note**: Configuration for VxAT and identity providers must be done from the command line or APIs. These configurations are not currently available from the web UI.

### Table 3-36  Identity provider configuration

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View and validate the configured VxAT domains. View all the configured SAML identity provider configurations.</td>
</tr>
<tr>
<td>Create</td>
<td>Add a domain to NetBackup through VxAT. Add a SAML identity provider configuration.</td>
</tr>
<tr>
<td>Update</td>
<td>Update a SAML identity provider configuration.</td>
</tr>
<tr>
<td>Delete</td>
<td>Delete a configured VxAT domain. Delete a SAML identity provider configuration.</td>
</tr>
<tr>
<td>Manage access</td>
<td>See &quot;Manage access&quot; on page 82.</td>
</tr>
</tbody>
</table>

### Key Management Services (KMS)

With KMS permissions a user can view and manage NetBackup KMS, external KMS, or configure encryption for a storage server or a disk volume. These operations are only available from the NetBackup APIs.

### Table 3-37  Key Management Service

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the KMS configuration details.</td>

</tbody>
</table>

**Global security settings**

These permissions manage access control on the **Global security** settings for the NetBackup master server.

Table 3-38  Security properties

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
</table>
| Update      | Manage security settings for the NetBackup master server. These settings affect communication with 8.0 and earlier hosts, automatic mapping of host ID to host names, and the security level for certificate deployment.  
See “Certificate authority for secure communication” on page 111.  
**Note:** Permissions for trusted master servers are located in the NetBackup management > Trusted master servers RBAC settings. |
| Manage access| See "Manage access" on page 82.                                                                                                                                                                             |

**Trust versions**

These permissions allow a user to view the trust version and its details for the master server. The trust version defines the certificate authority (CA) in the domain that hosts must trust. These operations are only available from the NetBackup APIs.

Table 3-39  RBAC permissions for trust versions

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the trust version details of the trust version, including which CA must be part of trust store.</td>

<td>See “Manage access” on page 82.</td>
</tr>
</tbody>
</table>

Global > Storage

Storage permissions include the following categories:
The storage permissions allow a user to administer storage for backups, replication, and long-term retention.

**Cloud storage**

These permissions allow users to view the configurations for cloud “Storage as a Service” (STaaS) vendors that NetBackup supports.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View the NetBackup-supported configurations of a cloud storage vendor.</td>
<td></td>
</tr>
<tr>
<td>Manage access</td>
<td>API only. See &quot;Manage access&quot; on page 82.</td>
<td>View</td>
</tr>
</tbody>
</table>

**Disk pools**

These permissions allow a user to view and manage disk pools for use with AdvancedDisk, cloud, MSDP, OpenStorage, and replication.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>View</td>
<td>View disk pools.</td>

<tr>
<td>Delete</td>
<td>Delete disk pools.</td>
<td>View</td>
</tr>
<tr>
<td>Manage access</td>
<td>API only. See “Manage access” on page 82.</td>
<td>View</td>
</tr>
</tbody>
</table>

### Storage Key Management Services
Permissions for Storage Key Management Services (KMS) allow a user to encrypt a storage server or a disk volume with NetBackup KMS or with external KMS. These operations are only available from the NetBackup APIs.

Permissions for KMS are managed in **Security**. See “Key Management Services (KMS)” on page 63.

### Table 3-47  RBAC permissions for Storage Key Management Services

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
<th>Additional required operations</th>

<td>View</td>
</tr>
</tbody>
</table>

### Storage servers

**Note:** In NetBackup 8.3, universal shares are only supported with Media Server Deduplication Pool (MSDP).

Permissions for storage servers allow user to view and manage storage servers and universal shares.

Permissions to view and create instant access mounts from universal shares backups are in **RBAC > Assets > Universal shares**.

Universal shares

**Note:** In NetBackup 8.3, the ability to restore from universal share backups is only available from the NetBackup CLI or the Backup, Archive, and Restore interface. Instant access recovery is only available through the NetBackup APIs.

Permissions for universal share assets allow users to view and create instant access mounts from universal share backups images. Permissions to create and manage universal shares are in **Global > Storage > Storage servers**.

See “**Global > Storage**” on page 67.

**Table 3-57** Permissions for universal shares

<table>

### Protection plans

Permissions for protection plans allow a user to view and manage protection plans and to add assets to a protection plan.
## Protecting assets

To view the storage that is associated with a protection plan, a user must also have **View** permission for the **Storage**. This permission is necessary to view the storage when you subscribe an asset to a plan. See “Global > Storage” on page 67.

To add assets to a protection plan or select **Backup now** for an immediate backup, the user needs to have permissions **View** and **Subscribe** on the protection plan. Additionally, the user needs permissions to **View** and **Protect** the assets. See “Assets” on page 72.

### Credentials

Credential permissions allow a user to view and manage the credentials that are used for the following workloads: Microsoft SQL Server and external Key Management Services (KMS).

When user creates a credential, that user is given full permissions on that credential.

### Table 3-60 RBAC permissions for credentials

</tbody>
</table>

## Manage access

The **Manage access** permission allows a user to manage the roles and role permissions for a specific permission category. For example, a user that has **View** and **Manage access** for *User sessions* can view and manage the roles that have access to the *User sessions* settings and the permissions that those roles have. The user must also have **View** on the roles they want to select and give access to *User sessions*.

This permission is available for each permission category. However, for some categories the **Manage access** functionality is only available from the NetBackup APIs and not the NetBackup web UI (indicated with “API only”).
Grant a role the manage access permissions

To grant a role manage access permissions

1. On the left, select RBAC node and click on the Roles tab.
2. Select one of the following:

   Add a role
   - Click Add.
   - Enter a role name and under Select permissions, click Assign.

   Update a role
   - Note: Permissions for Assets, Protection plans, and Credentials can only be edited when you add a role.
   - Select the role that you want to edit.

3. For each category that you want the role to have manage access permissions, select the Manage access permission.

   For example, you can create a role that can manage access to VMware assets, RHV assets, credentials, and protection plans.

   ![Assign permissions](image)

4. Users that manage access also need Access control permissions.
Manage the permissions for an area of the web UI

The Manage access permission allows a user to manage the roles and role permissions for a specific area of the web UI. For example, a user that has View and Manage access for User sessions can view and manage the roles that have access to the User sessions settings and the permissions that those roles have.
Add a role and give access to an area of the web UI

To add a role and give access to an area of the web UI

1. On the left, select the node for which you want to manage access.
2. On the top right, click Manage permissions.

For some categories, the option is available from a menu of options at the top right. For example, for VMware select VMware settings > Manage permissions.

3. Click Add.
4. Select the role you want to add and select the permissions that you want the role to have.
5. Click Save.

Edit the permissions for a role that has access to an area of the web UI

To edit the permissions for a role that has access to an area of the web UI

1. On the left, select the node for which you want to manage access.
2. On the top right, click Manage permissions.

For some categories, the option is available from a menu of options at the top right. For example, for VMware select VMware settings > Manage permissions.

3. Select the role that you want to edit and click Actions > Edit.
4. Select or remove the permissions for the role and click Save.
Remove a role that has access to an area of the web UI

To remove a role that has access to an area of the web UI

1. On the left, select the node for which you want to manage access.
2. On the top right, click **Manage permissions**.
   
   For some categories, the option is available from a menu of options at the top right. For example, for VMware select **VMware settings > Manage permissions**.
3. Select the role that you want to remove and click **Remove > Remove**.

View access definitions

The **Manage access** permission allows a user to view the access definitions that are related to a role. A user must have **Manage access** specifically on the permission category that they need to manage. For example, VMware or specific VMware objects.

To view access definitions

1. On the left, select **RBAC** node and click on the **Roles** tab.
2. Click on the role.
3. Click on the **Access definitions** tab.
Configure an external certificate for the NetBackup web server

By default, NetBackup uses the security certificates that the NetBackup CA has issued. If you have a certificate that an external CA has issued, you can configure the NetBackup web server to use it for secure communication.

**Note:** Windows certificate store is not supported as certificate source for the NetBackup web server.

To configure an external certificate for the web server

1. Ensure that you have valid certificate, private key of the certificate, and trusted CA bundle.
2. Run the following command:

   ```
   configureWebServerCerts -addExternalCert -nbHost -certPath certificate path -privateKeyPath private key path -trustStorePath CA bundle path [-passphrasePath passphrase file path]
   ```

   The `configureWebServerCerts` command does not support use of Windows certificate store paths.

   Refer to the NetBackup Commands Reference Guide for more details on the command-line options.

   - In a clustered setup, to avoid a failover run the following command on the active node:

     ```
     install_path/netbackup/bin/bpclusterutil -freeze
     ```

3. Restart the NetBackup Web Management Console service to reflect the changes.

   On UNIX, run the following commands:

   - `install_path/netbackup/bin/nbwmc -terminate`
   - `install_path/netbackup/bin/nbwmc start`

   On Windows, use the Services application in the Windows Control Panel.

Location of the commands:

Windows: `install_path\NetBackup\wmc\bin\install`

UNIX: `install_path/wmc/bin/install`
In a clustered setup, unfreeze the cluster using the following command on the active node:

```
install_path/netbackup/bin/bpclusterutil -unfreeze
```

4 Verify that you can access the NetBackup web user interface using a browser, without a certificate warning message.

## Update or renew the external certificate for the web server

You can update or renew the external certificate that you configured for the web server.

**To update or renew the external certificate for the web server**

1 Ensure that you have the latest external certificate, the matching private key, and the CA bundle file.

2 Run the following command (in a clustered setup, run the command on the active node):

```
configureWebServerCerts -addExternalCert -nbHost -certPath certificate path -privateKeyPath private key path -trustStorePath CA bundle path
```

## Remove the external certificate configured for the web server

You can remove the external certificate that is configured for the web server. NetBackup then uses the NetBackup CA-signed certificate for secure communication.

**To remove the external certificate configured for the web server**

1 Run the following command (in a clustered master server setup, run this command on the active node):

```
configureWebServerCerts -removeExternalCert -nbHost
```

- In a clustered master server setup, run the following command on the active node to freeze the cluster to avoid a failover:

```
install_path/netbackup/bin/bpclusterutil -freeze
```

2 Restart the NetBackup Web Management Console service.

- In a clustered master server setup, run the following command on the active node to unfreeze the cluster:

```
install_path/netbackup/bin/bpclusterutil -unfreeze
```
Security events and audit logs

This chapter includes the following topics:

- View security events and audit logs
- About NetBackup auditing
- Send audit events to system logs

View security events and audit logs

NetBackup audits user-initiated actions in a NetBackup environment to help answer who changed what and when they changed it. For a full audit report, use the `nbauditreport` command. See “Viewing the detailed NetBackup audit report” on page 94.

To view security events and audit logs

1. On the left, select Security > Security events.
2. The following options are available.
   - Click Access history to view the users that accessed NetBackup.
   - Click Audit events to view the events that NetBackup audited. These events include changes to security settings, certificates, and users who browsed or restored backups images.

About NetBackup auditing

Auditing is enabled by default in new installations. NetBackup auditing can be configured directly on a NetBackup master server.
Auditing of NetBackup operations provides the following benefits:

- Customers can gain insight from audit trails while they investigate unexpected changes in a NetBackup environment.
- Regulatory compliance. The record complies with guidelines such as those required by the Sarbanes-Oxley Act (SOX).
- A method for customers to adhere to internal change management policies.
- Help for NetBackup Support in troubleshooting problems for customers.

About the NetBackup Audit Manager

The NetBackup Audit Manager (nbaudit) runs on the master server and audit records are maintained in the Enterprise Media Manager (EMM) database. An administrator can search specifically for:

- When an action occurred
- Failed actions in certain situations
- The actions that a specific user performed
- The actions that were performed in a specific content area
- Changes to the audit configuration

Note the following:

- The audit record truncates any entries greater than 4096 characters. (For example, policy name.)
- The audit record truncates any restore image IDs greater than 1024 characters.

Actions that NetBackup audits

NetBackup records the following user-initiated actions.

<table>
<thead>
<tr>
<th>Activity monitor actions</th>
<th>Canceling, suspending, resuming, restarting, or deleting any type of job creates an audit record.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alerts and email notifications</td>
<td>If an alert cannot be generated or an email notification cannot be sent for NetBackup configuration settings. For example, SMTP server configuration and the list of excluded status codes for alerts.</td>
</tr>
<tr>
<td>Asset actions</td>
<td>Deleting an asset, such as a vCenter server, as part of the asset cleanup process with the Asset Database API is audited and logged. Creating, modifying, or deleting an asset group as well any action on an asset group for which a user is not authorized is audited and logged.</td>
</tr>
<tr>
<td>Authorization failure</td>
<td>Authorization failure is audited when you use the NetBackup web UI, the NetBackup APIs, or Enhanced Auditing.</td>
</tr>
<tr>
<td>-----------------------</td>
<td>------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Catalog information</td>
<td>This information includes:</td>
</tr>
<tr>
<td></td>
<td>■ Verifying and expiring images.</td>
</tr>
<tr>
<td></td>
<td>■ Read the requests that are sent for the front-end usage data.</td>
</tr>
<tr>
<td>Certificate management</td>
<td>Creating, revoking, renewing, and deploying of NetBackup certificates and specific NetBackup certificate failures.</td>
</tr>
<tr>
<td>Certificate Verification Failures (CVFs)</td>
<td>Any failed connection attempts that involve SSL handshake errors, revoked certificates, or host name validation failures.</td>
</tr>
<tr>
<td></td>
<td>For certificate verification failures (CVFs) that involve SSL handshakes and revoked certificates, the timestamp indicates when the audit record is posted to the master server. (Rather than when an individual certificate verification fails.) A CVF audit record represents a group of CVF events over a time period. The record details provide the start and the end times of the time period as well as the total number of CVFs that occurred in that period.</td>
</tr>
<tr>
<td>Disk pools and Volume pools actions</td>
<td>Adding, deleting, or updating disk or volume pools.</td>
</tr>
<tr>
<td>Hold operations</td>
<td>Creating, modifying, and deleting hold operations.</td>
</tr>
<tr>
<td>Host database</td>
<td>NetBackup host database-related operations.</td>
</tr>
<tr>
<td>Logon attempts</td>
<td>Any successful or any failed logon attempts for the NetBackup Administration Console, the NetBackup web UI or the NetBackup APIs.</td>
</tr>
<tr>
<td>Policies actions</td>
<td>Adding, deleting, or updating policy attributes, clients, schedules, and backup selections lists.</td>
</tr>
<tr>
<td>Restore and browse image user actions</td>
<td>All the restore and browse image content (bplist) operations that a user performs are audited with the user identity.</td>
</tr>
<tr>
<td></td>
<td>To set an interval to periodically add audit records of the browse image (bplist) operations from the cache into the NetBackup database, use the DATAACCESS_AUDIT_INTERVAL_HOURS configuration option. Setting this configuration option prevents the NetBackup database size from increasing exponentially because of the bplist audit records.</td>
</tr>
<tr>
<td></td>
<td>See the NetBackup Administrator's Guide Volume I.</td>
</tr>
<tr>
<td></td>
<td>To add all the bplist audit records from the cache into the NetBackup database, run the following command on the master server:</td>
</tr>
<tr>
<td></td>
<td>nbcertcmd -postAudit -dataAccess</td>
</tr>
<tr>
<td>Security configuration</td>
<td>Information that is related to changes that are made to the security configuration settings.</td>
</tr>
</tbody>
</table>
Starting a restore job

NetBackup does not audit when other types of jobs begin. For example, NetBackup does not audit when a backup job begins.

Starting and stopping the NetBackup Audit Manager (nbaudit).

Starting and stopping of the nbaudit manager is always audited, even if auditing is disabled.

Storage lifecycle policy actions

Attempts to create, modify, or delete a storage lifecycle policy (SLP) are audited and logged. However, activating and suspending an SLP using the command nbstlutil are not audited. These operations are audited only when they are initiated from a NetBackup graphical user interface or API.

Storage servers actions

Adding, deleting, or updating storage servers.

Storage units actions

Adding, deleting, or updating storage units.

Note: Actions that are related to storage lifecycle policies are not audited.

Token management

Creating, deleting, and cleanup of tokens and specific token issuing failures.

User management

Adding and deleting Enhanced Auditing users in the Enhanced Auditing mode.

User action that fails to create an audit record

If auditing is enabled but a user action fails to create an audit record, the audit failure is captured in the nbaudit log. NetBackup status code 108 is returned (Action succeeded but auditing failed). The NetBackup Administration Console does not return an exit status code 108 when auditing fails.

Actions that NetBackup does not audit

The following actions are not audited and do not display in the audit report:

Any failed actions.

NetBackup logs failed actions in NetBackup error logs. Failed actions do not display in audit reports because a failed attempt does not bring about a change in the NetBackup system state.

The effect of a configuration change

The results of a change to the NetBackup configuration are not audited. For example, the creation of a policy is audited, but the jobs that result from its creation are not.

The completion status of a manually initiated restore job

While the act of initiating a restore job is audited, the completion status of the job is not audited. Nor is the completion status of any other job type, whether initiated manually or not. The completion status is displayed in the Activity Monitor (Administration Console) and in the Jobs (web UI).

Internally initiated actions

NetBackup-initiated internal actions are not audited. For example, the scheduled deletion of expired images, scheduled backups, or periodic image database cleanup is not audited.
Some operations are carried out as multiple steps. For example, creating an MSDP-based storage server consists of multiple steps. Every successful step is audited. Failure in any of the steps results in a rollback, or rather, the successful steps may need to be undone. The audit record does not contain details about rollback operations.

Changes made using the `bpsetconfig` or the `nbsetconfig` commands, or the equivalent property in the Host Properties utility, are not audited. Changes that are made directly to the `bp.conf` file or to the registry are not audited.

User identity in the audit report

The audit report indicates the identity of the user who performed a specific action. The full identity of the user includes the user name and the domain or the host name that is associated with the authenticated user. A user’s identity appears in the audit report as follows:

- Audit events always include the full user identity. Root users and administrators are logged as “root@hostname” or “administrator@hostname”.
- In NetBackup 8.1.2 and later, image browse and image restore events always include the user ID in the audit event. NetBackup 8.1.1 and earlier log these events as “root@hostname” or “administrator@hostname”.
- For any operations that do not require credentials or require the user to sign in, operations are logged without a user identity.

Audit retention period and catalog backups of audit records

The audit records are kept as part of the NetBackup database, for as long as the retention period indicates. The records are backed up as part of the NetBackup catalog backup. The NetBackup Audit Service (`nbaudit`) deletes expired audit records once every 24 hours at 12:00 A.M. (local time).

By default, audit records are kept for 90 days. Use an audit retention period value of 0 (zero) if you do not want to delete the audit records.
To configure the audit retention period

1. Log on to the master server.
2. Open the following directory:
   - Windows: `install_path\NetBackup\bin\admincmd``
   - UNIX: `/usr/openv/netbackup/bin/admincmd``
3. Enter the following command:

   `nbemcmd -changesetting -AUDIT_RETENTION_PERIOD number_of_days -machinename masterserver``

   Where `number_of_days` indicates (in days) how long audit records are to be retained for the audit report.

   In the following example, the records of user actions are retained for 30 days and then deleted.

   `nbemcmd -changesetting -AUDIT_RETENTION_PERIOD 30 -machinename server1``

   To ensure that audit records are not missed from a catalog backup, configure the catalog backup frequency to be less frequent or equal to the `-AUDIT_RETENTION_PERIOD``.

Viewing the detailed NetBackup audit report

You can see detailed NetBackup audit event information with the `nbauditreport`` command.

To view the full audit report

1. Log on to the master server.
2. Enter the following command to display the audit report in the summary format.

   - Windows: `install_path\NetBackup\bin\admincmd\nbauditreport``
   - UNIX: `/usr/openv/netbackup/bin/admincmd\nbauditreport``

   Or, run the command with the following options.

   `-sdate <"MM/DD/YY [HH:[MM[:SS]]]">`

   The start date and time of the report data you want to view.
-edate

"MM/DD/YY
[HH:[MM[:SS]]]"

The end date and time of the report data you want to view.

-ctgy category

The category of user action that was performed. Categories such as POLICY may contain several sub-categories such as schedules or backup selections. Any modifications to a sub-category are listed as a modification to the primary category.

See the NetBackup Commands Guide for -ctgy options.

-user

<username[:domainname]>

Use to indicate the name of the user for whom you'd like to display audit information.

-fmt DETAIL

The -fmt DETAIL option displays a comprehensive list of audit information. For example, when a policy is changed, this view lists the name of the attribute, the old value, and the new value. This option has the following sub-options:

■ [-notruncate] . Display the old and new values of a changed attribute on separate lines in the details section of the report.
■ [-pagewidth <NNN>] . Set the page width for the details section of the report.

-fmt PARSABLE

The -fmt PARSABLE option displays the same set of information as the DETAIL report but in a parsable format. The report uses the pipe character (|) as the parsing token between the audit report data. This option has the following sub-options:

■ [-order<DTU|DUT|TDU|TUD|UDT|UTD>]. Indicate the order in which the information appears.
  D (Description)
  T (Timestamp)
  U (User)
The audit report contains the following details:

| DESCRIPTION | The details of the action that was performed. |
| USER | The identity of the user who performed the action. See "User identity in the audit report" on page 93. |
| TIMESTAMP | The time that the action was performed. |

The following information only displays if you use the -fmt DETAIL or the -fmt PARSABLE options.

| CATEGORY | The category of user action that was performed. |
| ACTION | The action that was performed. |
| REASON | The reason that the action was performed. A reason displays if a reason was specified for the operation that created the change. |
| DETAILS | An account of all of the changes, listing the old values and the new values. |

Example of the audit report:

```
[root@server1 admincmd]# ./nbauditreport
04/20/2018 11:52:43 root@server1 Policy 'test_pol_1' was saved but no changes were detected
04/20/2018 11:52:42 root@server1 Schedule 'full' was added to Policy 'test_pol_1'
04/20/2018 11:52:41 root@server1 Policy 'test_pol_1' was saved but no changes were detected
04/20/2018 11:52:08 root@server1 Policy 'test_pol_1' was created
04/20/2018 11:17:00 root@server1 Audit setting(s) of master server 'server1' were modified

Audit records fetched: 5
```

Send audit events to system logs

You can send NetBackup audit events to system logs. Ensure that you have the following permissions to carry out this task:

- View permission on the Security > Security events UI
View, Create, Update, and Delete permissions on the NetBackup management > NetBackup hosts UI

To send audit events to system logs

1. On the left, select Security > Security events.
2. On the top right, click Audit event settings.
3. Enable Send the audit events to the system logs option.
4. In the Audit event categories dialog box, select the audit categories for which you want to send the audit events to the system logs.
   - To send audit events for all audit categories to the system logs, select the Audit event categories check box.
5. Click Save.

You can view NetBackup audit events in the system logs. For example:

- On a Windows system, use Windows Event Viewer to view NetBackup audit events.
- On a Linux system, you can view the system logs on the configured location.
Managing security certificates

This chapter includes the following topics:

- About security management and certificates in NetBackup
- NetBackup host IDs and host ID-based certificates
- Managing NetBackup security certificates
- Using external security certificates with NetBackup

About security management and certificates in NetBackup

NetBackup uses security certificates to authenticate the NetBackup hosts. These certificates must conform to the X.509 public key infrastructure (PKI) standard. With NetBackup 8.1, 8.1.1, and 8.1.2, NetBackup certificates are used for secure communication. In NetBackup 8.2 and later you can use NetBackup certificates or external certificates.

NetBackup certificates are issued to hosts by default and the NetBackup master server acts as the CA and manages the Certificate Revocation List (CRL). The NetBackup certificate deployment security level determines how certificates are deployed to NetBackup hosts and how often the CRL is updated on each host. If a host needs a new certificate (the original certificate is expired or revoked), you can use an NetBackup authorization token to reissue the certificate.

External certificates are those that a trusted external CA signed. When you configure NetBackup to use external certificates, the master server, media servers, and clients in the NetBackup domain use the external certificates for secure communication.
Additionally, the NetBackup web server uses these certificates for communication between the NetBackup web UI and the NetBackup hosts. Deployment of external certificates, updating or replacing external certificates, and CRL management for the external CA are managed outside of NetBackup.

For more information on external certificates, see the NetBackup Security and Encryption Guide.

Security certificates for NetBackup 8.1 and later hosts

NetBackup 8.1 and later hosts can communicate with each other only in a secure mode. Depending on the NetBackup version, these hosts must have a certificate that the NetBackup CA issued or that another trusted CA issued. A NetBackup certificate that is used for secure communications over a control channel is also referred to as host ID-based certificate.

Security certificates for NetBackup 8.0 hosts

Any security certificates that NetBackup generated for 8.0 hosts are referred to as host name-based certificates. For more details on these certificates, refer to the NetBackup Security and Encryption Guide.

NetBackup host IDs and host ID-based certificates

Each host in a NetBackup domain has a unique identity, which is referred to as a host ID or a Universally Unique Identifier (UUID). The host ID is used in many operations to identify the host. NetBackup creates and manages host IDs as follows:

- Maintains a list on the master server of all of the host IDs that have certificates.
- Randomly generates host IDs. These IDs are not tied to any property of the hardware.
- By default, assigns NetBackup 8.1 and later hosts a host ID-based certificate that is signed by the NetBackup certificate authority.
- The host ID remains the same even when the host name changes.

In some cases a host can have multiple host IDs:

- If a host obtains certificates from multiple NetBackup domains, it has multiple host IDs that correspond to each NetBackup domain.
- When the master server is configured as part of a cluster, each node in the cluster receives a unique host ID. An additional host ID is assigned for the virtual name. For example, if the master server cluster is composed of $N$ nodes, the number of host IDs that are allocated for the master server cluster is $N + 1$. 
Managing NetBackup security certificates

**Note:** The information here only applies to the security certificates that are issued by the NetBackup certificate authority (CA). More information is available for external certificates.

See “Using external security certificates with NetBackup” on page 104.

You can view and revoke NetBackup certificates and view information about the NetBackup CA. More detailed information about NetBackup certificate management and certificate deployment is available in the NetBackup Security and Encryption Guide.

**View a NetBackup certificate**

You can view details of all host ID-based NetBackup certificates that are issued to NetBackup hosts. Note that only 8.1 and later NetBackup hosts have host ID-based certificates. The Certificates list does not include any NetBackup 8.0 or earlier hosts.

**To view a NetBackup certificate**

1. On the left, select Security > Certificates.
2. Click NetBackup certificates.
3. To view additional certificate details for a host, click on a host name.

**Revoke a NetBackup CA certificate**

When you revoke a NetBackup host ID-based certificate, NetBackup revokes any other certificates for that host. NetBackup ceases to trust the host, and it can no longer communicate with the other NetBackup hosts.

You may choose to revoke a host ID-based certificate under various conditions. For example, if you detect that client security has been compromised, if a client is decommissioned, or if NetBackup is uninstalled from the host. A revoked certificate cannot be used to communicate with master server web services.

Security best practices suggest that the NetBackup security administrator explicitly revoke the certificates for any host that is no longer active. This action should be taken regardless of whether the certificate is still deployed on the host, or whether it has been successfully removed from the host.

**Note:** Do not revoke a certificate of the master server. If you do, NetBackup operations may fail.
To revoke a NetBackup CA certificate
1. On the left, select Security > Certificates.
2. Click NetBackup certificates.
3. Click on the host name that is associated with the certificate that you want to revoke.
4. Click Revoke Certificate > Yes.

View the NetBackup certificate authority details and fingerprint
For secure communication with the NetBackup certificate authority (CA) on the master server, a host’s administrator must add the CA certificate to an individual host’s trust store. The master server administrator must give the fingerprint of the CA certificate to the administrator of the individual host.

To view the NetBackup certificate authority details and fingerprint
1. On the left, select Security > Certificates.
2. Click NetBackup certificates.
3. In the toolbar, click Certificate authority.
4. Find the Fingerprint information and click Copy to clipboard.
5. Provide this fingerprint information to the host’s administrator.

Reissue a NetBackup certificate

Note: The information here only applies to the security certificates that are issued by the NetBackup certificate authority (CA). External certificates must be managed outside of NetBackup.

In some cases a host’s NetBackup certificate is no longer valid. For example, if a certificate is expired, revoked, or is lost. You can reissue a certificate either with or without a reissue token.

A reissue token is a type of authorization token that is used to reissue a NetBackup certificate. When you reissue a certificate, the host gets the host ID same as the original certificate.

Reissue a NetBackup certificate, with a token
If you need to reissue a host’s NetBackup certificate and want a more secure method to do so, you can create an authorization token that the host administrator must use to obtain a new certificate. This reissue token retains the same host ID as the
original certificate. The token can only be used once. Because it is associated to a specific host, the token cannot be used to request certificates for other hosts.

To reissue a NetBackup certificate for a host

1. On the left, select Security > Hosts.
2. Click NetBackup certificates.
3. Select the host and click Generate reissue token.
4. Enter a token name and indicate how long the token should be valid for.
5. Click Create.
6. Click Copy to clipboard and click Close.
7. Share the authorization token so the host's administrator can obtain a new certificate.

Allow a NetBackup certificate reissue, without a token

In certain scenarios, like BMR client restore, you need to reissue a certificate without a reissue token. The Allow auto reissue certificate option enables you to reissue a certificate without requiring a token.

To allow a NetBackup certificate reissue, without a token

1. On the left, select Security > Hosts.
2. Click NetBackup certificates.
3. Select the host and click Allow auto reissue certificate > Allow.

Once you set the Allow auto reissue certificate option, a certificate can be reissued without a token within the next 48 hours, which is the default setting. After this window to reissue expires, the certificate reissue operation requires a reissue token.
4. Notify the host’s administrator that you allowed a NetBackup certificate reissue without a token.

Revoke the ability to reissue a NetBackup certificate without a token

After you allow a NetBackup certificate reissue without a token, you can revoke this ability before the window to reissue expires. By default, the window is 48 hours.

To revoke the ability to reissue a NetBackup certificate without a token

1. On the left, select Security > Hosts.
2. Click NetBackup certificates.
3. Select the host and click Revoke auto reissue certificate > Revoke.
Managing NetBackup certificate authorization tokens

**Note:** The information here only applies to the security certificates that are issued by the NetBackup certificate authority (CA). External certificates must be managed outside of NetBackup.

Depending on the security level for NetBackup certificate deployment, you may need an authorization token to issue a new NetBackup certificate to a host. You can create a token when it is required or find and copy a token if it is needed again. Tokens can be cleaned up or deleted if they are no longer needed.

To reissue a certificate, a reissue token is required in most cases. A reissue token is associated with the host ID.

**Create an authorization token**

Depending on the NetBackup certificate deployment security level, an authorization token may be required for a non-master NetBackup host to obtain a host ID-based NetBackup certificate. The NetBackup administrator of the master server generates the token and shares it with the administrator of the non-master host. That administrator can then deploy the certificate without the presence of the master server administrator.

Do not create an authorization token for a NetBackup host whose current certificate is not in a valid state because it is lost, corrupt, or expired. In these cases, a reissue token must be used.

See "Reissue a NetBackup certificate" on page 101.

**To create an authorization token**

1. On the left, select **Security > Tokens**.
2. In the upper-right corner, click **Add**.
3. Enter the following information for the token:
   - Token name
   - The maximum number of times you want the token to be used
   - How long the token is valid for
4. Click **Create**.

**To find and copy an authorization token value**

You can view the details of the tokens that you have created and copy the token value for future use.
To find and copy an authorization token value

1. On the left, select **Security > Tokens**.
2. Select the name of the token for which you want to view the details.
3. At the top right, click **Show Token** and then click the **Copy to clipboard** icon.

**Cleanup tokens**

Use the Cleanup tokens utility to delete tokens from the token database that are expired or that have reached the maximum number of uses allowed.

To clean up tokens

1. On the left, select **Security > Tokens**.
2. Click **Cleanup > Yes**.

Delete a token

You can delete a token can be deleted before it is expired or before the **Maximum Uses Allowed** is reached.

To delete a token

1. On the left, select **Security > Tokens**.
2. Select the name of the tokens that you want to delete.
3. Click **Delete** in the upper-right corner.

Using external security certificates with NetBackup

NetBackup 8.2 and later versions support the security certificates that are issued by an external CA. External certificates and the certificate revocation list for an external certificate authority must be managed outside of NetBackup. The **External certificates** tab displays details for the NetBackup 8.1 and later hosts in the domain and whether or not they use external certificates.

See “View external certificate information for the NetBackup hosts in the domain” on page 105.

Before you can see external certificate information in **Certificates > External certificates**, you must first configure the master server and the NetBackup web server to use external certificates. See the **NetBackup Security and Encryption Guide** for details.

See the video **External CA support in NetBackup** for details.

**Video link**
View external certificate information for the NetBackup hosts in the domain

**Note:** Before you can see external certificate information, you must configure NetBackup for external certificates. See the NetBackup Security and Encryption Guide for details.

As you add external certificates to the hosts in the NetBackup domain, use the **External certificates** dashboard to track which hosts need attention. To support an external certificate, a host must be upgraded and enrolled with an external certificate.

**To view external certificate information for the hosts**

1. On the left, select **Security > Certificates**.
2. Click **External certificates**.

In addition to hosts information and details for the hosts' external certificates, the following information is also included:

- The **NetBackup certificate status** column indicates if a host also has a NetBackup certificate.

- The **External certificate** dashboard contains the following information for NetBackup 8.1 and later hosts:
  - Total hosts. The total number hosts. The hosts must be online and able to communicate with NetBackup master server.
  - Hosts with certificates. The number of hosts that have a valid external certificate enrolled with the NetBackup master server.
  - Host missing certificates. Either the host supports external certificates, but does not have one enrolled. Or, an upgrade to NetBackup 8.2 is required for the host (applies to versions 8.1, 8.1.1, or 8.1.2). The **NetBackup upgrade required** total also includes any hosts that were reset or any hosts for which the NetBackup version is unknown. NetBackup 8.0 and earlier hosts do not use security certificates and are not reflected here.
  - Certificate expiry. The hosts that have an expired or expiring external certificate.

**View details for a host's external certificate**

You can view details of a host's certificate that was issued by an external certificate authority.
To view details for a host’s external certificate

1. On the left, select **Security > Certificates**.
2. Click **External certificates**.
   - The list of external certificates displays for the master server.
3. To view additional certificate details for a host, click on a host name.
Managing user sessions

This chapter includes the following topics:

- Sign out a NetBackup user session
- Unlock a NetBackup user
- Configure when idle sessions should time out
- Configure the maximum of concurrent user sessions
- Configure the maximum of failed sign-in attempts
- Display a banner to users when they sign in

Sign out a NetBackup user session

For security or maintenance purposes, you can sign out one or more NetBackup user sessions. To configure NetBackup to automatically sign out any idle user sessions, see the following topic.

See “Configure when idle sessions should time out” on page 108.

**Note:** Changes to a user’s access rules are not immediately reflected in the web UI. An administrator must terminate the active user session before any changes take effect. Or, the user must sign out and sign in again.

To sign out a user session

1. On the left, select **Security > User sessions**.
2. Click **Active sessions**.
3. Select the user session that you want to sign out.
4. Click **Terminate session**.
To sign out all user sessions
1 On the left, select Security > User sessions.
2 Click Active sessions.
3 Click Terminate all sessions.

Unlock a NetBackup user

You can view the user accounts that are currently locked out of NetBackup and unlock one or more users.

By default a user's account only remains locked for 24 hours. You can change this time by adjusting the User sessions > User account settings > User account lockout setting.

See “Configure the maximum of failed sign-in attempts” on page 109.

To unlock out a locked user account
1 On the left, select Security > User sessions.
2 Click Locked users.
3 Select the user account that you want to unlock.
4 Click Unlock.

To unlock all locked user accounts
1 On the left, select Security > User sessions.
2 Click Locked users.
3 Click Unlock all users.

Configure when idle sessions should time out

You can customize when user sessions should time out and a user is automatically signed out. The setting you choose is applied to the NetBackup Administration Console and the NetBackup web UI. To configure this setting from the command line, use nbsetconfig to set the GUI_IDLE_TIMEOUT option.

To configure when idle sessions should time out
1 Select Security > User sessions.
2 Click User account settings.
3 Turn on Session idle timeout and click Edit.
4 Select the number of minutes and click Save.
   Wait 3-5 minutes for NetBackup to update the environment with the changes. Or, restart the NetBackup web services to apply the changes immediately. For active users, the updates are applied the next time the user signs in.

**Configure the maximum of concurrent user sessions**

This setting limits the number of concurrent API sessions that a user can have active. API sessions are used for some applications in the NetBackup Administration Console. This setting does not apply to API key sessions or to other applications like the NetBackup Backup, Archive, and Restore interface. To configure this setting from the command line, use `nbsetconfig` to set the `GUI_MAX_CONCURRENT_SESSIONS` option.

**To configure the maximum of concurrent user sessions**

1 Select Security > User sessions.
2 Click User account settings.
3 Turn on Maximum concurrent sessions and click Edit.
4 Select the Number of concurrent sessions per user and click Save.
   Wait 3-5 minutes for NetBackup to update the environment with the changes. Or, restart the NetBackup web services to apply the changes immediately. For active users, the updates are applied the next time the user signs in.

**Configure the maximum of failed sign-in attempts**

You can customize the maximum number of NetBackup failed sign-in attempts. The setting you choose applies only to the NetBackup web UI. To configure this setting from the command line, use `nbsetconfig` to set the `GUI_MAX_LOGIN_ATTEMPTS` and `GUI_ACCOUNT_LOCKOUT_DURATION` options.

**To configure the maximum of failed sign-in attempts**

1 Select Security > User sessions.
2 Click User account settings.
3 Turn on User account lockout and click Edit.
4 Select the number of failed sign-in attempts that you want to allow before an account is locked.
5  To unlock a locked account after a period of time, select the number of minutes for **Unlock locked accounts after.**

6  Click **Save.**

   Wait 3-5 minutes for NetBackup to update the environment with the changes. Or, restart the NetBackup web services to apply the changes immediately. For active users, the updates are applied the next time the user signs in.

---

**Display a banner to users when they sign in**

You can configure a sign-in banner that displays each time that any user signs in to the NetBackup web UI. A different banner can be configured for any master server. This banner can also require the user to agree to the terms of service before the user signs in.

To configure the banner for the NetBackup Administration Console and the Backup, Archive, and Restore client, see the **NetBackup Administrator's Guide, Volume I.** To migrate the banner that is used for the NetBackup Administration Console to the NetBackup web UI, see the `nbmlb` command in the **NetBackup Commands Reference Guide.**

**To display a banner to users when they sign in**

1  Select **Security > User sessions.**

2  Click **User account settings.**

3  Turn on **Sign-in banner configuration** and click **Edit.**

4  Enter the text you want to use for the heading and the body of the message.

5  If you want to require the user to agree to the terms of service, select **Include "Agree" and "Disagree" buttons on the sign-in banner.**

6  Click **Save.**

   For active users, the updates are applied the next time the user signs in.
Managing master server security settings

This chapter includes the following topics:

- Certificate authority for secure communication
- Disable communication with NetBackup 8.0 and earlier hosts
- Disable automatic mapping of NetBackup host names
- About NetBackup certificate deployment security levels
- Select a security level for NetBackup certificate deployment
- Set a passphrase for disaster recovery
- About trusted master servers

Certificate authority for secure communication

In the global security settings, the Certificate authority information indicates the type certificate authorities that the NetBackup domain supports. Open Security > Global security to view these settings.

NetBackup hosts in the domain can use certificates as follows:

- NetBackup certificates.
  By default, NetBackup certificates are deployed on the master server and its clients.

- External certificates.
  You can configure NetBackup to only communicate with the hosts that use an external certificate. Requires that a host is upgraded to 8.2 or later and has an external certificate that is installed and enrolled. In this case, NetBackup does
not communicate with any hosts that use NetBackup certificates. However, you can enable **Allow communication with NetBackup 8.0 and earlier hosts** to communicate with any hosts that use NetBackup 8.0 or earlier.

- Both NetBackup certificates and external certificates.

  With this configuration, NetBackup communicates with the hosts that use a NetBackup certificate or an external certificate. If a host has both types of certificates, NetBackup uses the external certificate for communication.

### Disable communication with NetBackup 8.0 and earlier hosts

By default, NetBackup allows communication with NetBackup 8.0 and earlier hosts that are present in the environment. However, this communication is insecure. For increased security, upgrade all your hosts to the current NetBackup version and disable this setting. This action ensures that only secure communication is possible between NetBackup hosts. If you use Auto Image Replication (A.I.R.), you must upgrade the trusted master server for image replication to NetBackup 8.1 or later.

To communicate with an OpsCenter server, this setting must be enabled.

**To disable communication with NetBackup 8.0 and earlier hosts**

1. At the top right, select **Security > Global security**.
2. Turn off **Allow communication with NetBackup 8.0 and earlier hosts**.
3. Click **Save**.

### Disable automatic mapping of NetBackup host names

For successful communication between NetBackup hosts, all relevant host names and IP addresses need to be mapped to the respective host IDs. Use the **Automatically map host names to their NetBackup host ID** option to automatically map the host ID to the respective host names (and IP addresses) or disable it to allow the NetBackup security administrator to manually verify the mappings before approving them.

**To disable automatic mapping of NetBackup host names**

1. At the top right, click the **Settings > Global security**.
2. Turn off **Automatically map host names to their NetBackup host ID**.
3. Click **Save**.
About NetBackup certificate deployment security levels

Security levels for certificate deployment are specific to NetBackup CA-signed certificates. If the NetBackup web server is not configured to use NetBackup certificates for secure communication, the security levels cannot be accessed.

The NetBackup certificate deployment level determines the checks that are performed before the NetBackup CA issues a certificate to a NetBackup host. It also determines how frequently the NetBackup Certificate Revocation List (CRL) is refreshed on the host.

NetBackup certificates are deployed on hosts during installation (after the host administrator confirms the master server fingerprint) or with the `nbcertcmd` command. Choose a deployment level that corresponds to the security requirements of your NetBackup environment.

<table>
<thead>
<tr>
<th>Security level</th>

<td>5. The client is listed in at least one backup policy.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>6. The client is a legacy client. This is a client that was added using the <strong>Client Attributes</strong> host properties.</td>
<td></td>
</tr>
<tr>
<td><strong>Medium</strong></td>
<td>The certificates are issued without an authorization token if the master server can resolve the host name to the IP address from which the request was originated.</td>
<td>The CRL that is present on the host is refreshed every 8 hours.</td>
</tr>
</tbody>
</table>
Select a security level for NetBackup certificate deployment

NetBackup offers several security levels for the NetBackup certificate deployment. The security level determines what security checks the NetBackup certificate authority (CA) performs before it issues a certificate to a NetBackup host. The level also determines how frequently the Certificate Revocation List (CRL) for the NetBackup CA is refreshed on the host.

More details are available for security levels, NetBackup certificate deployment, and the NetBackup CRL:

- See “About NetBackup certificate deployment security levels” on page 113.
- See the NetBackup Security and Encryption Guide.

To select a security level for NetBackup certificate deployment

1. At the top, click **Settings > Global security**.
2. Click **Secure communication**.
3. For **Security level for NetBackup certificate deployment**, select a security level.

If you choose to use NetBackup certificates, they are deployed on hosts during installation, after the host's administrator confirms the master server fingerprint. The security level determines if an authorization token is required or not for a host.

**Very high**
NetBackup requires an authorization token for every new NetBackup certificate request.

**High (Default)**
NetBackup does not require an authorization token if the host is known to the master server, which means the host appears in a NetBackup configuration file, the EMM database, a backup policy, or the host is a legacy client.

**Medium**
NetBackup issues NetBackup certificates without an authorization token if the master server can resolve the host name to the IP address from which the request was originated.

4. Click **Save**.
**Set a passphrase for disaster recovery**

During a catalog backup, NetBackup creates a disaster recovery package and encrypts the backup with a passphrase that you set.

See the information for disaster recovery settings in the NetBackup Security and Encryption Guide.

**To set a passphrase for disaster recovery**

1. At the top, click **Settings > Global security**.
2. Click **Disaster recovery**.
3. Enter and confirm a passphrase.
4. Click **Save**.

**About trusted master servers**

A trust relationship between NetBackup domains lets you do the following:

- Select specific domains as a target for replication. This type of Auto Image Replication is known as targeted A.I.R.
  
  Without a trust relationship, NetBackup replicates to all defined target storage servers. A trust relationship is optional for Media Server Deduplication Pool and PureDisk Deduplication Pool as a target storage. To use a Cloud Catalyst storage server, a trust relationship is required.

- Include usage reporting for multiple master servers.

Master servers can use a NetBackup certificate authority (CA) certificate or an external CA certificate. NetBackup determines the CAs used by the source and the target domains and selects the appropriate CA to use for communication between the servers. If the target master server is configured for both CA types, NetBackup prompts you to select the CA that you want to use. To establish trust with a remote master server using the NetBackup CA, the current master and the remote master must have NetBackup version 8.1 or later. To establish trust with a remote master server using an external CA, the current master and the remote master must have NetBackup version 8.2 or later.
Table 7-2  Determining the certificate authority (CA) to use for a trust relationship between servers

<table>
<thead>
<tr>
<th>Source master server CA or CAs</th>
<th>Target master server CA or CAs</th>

</table>

Add a trusted master server

**Note:** The NetBackup web UI does not support adding a trusted master that uses version 8.0 or earlier.

You can create a trust relationship between the master servers that use the NetBackup CA or an external CA.

**To add a trusted master server**

1. For the servers that use the NetBackup certificate authority (CA), first obtain an authorization token for each server and the fingerprint for each server.
2. At the top, select **Settings > Global security**.
3. Select **Trusted master servers**.
4. Click the **Add** button.
5. Follow the prompts in the wizard.
6. Repeat these steps on the remote master server.

**More information**

For more information on using an external CA with NetBackup, see the NetBackup Security and Encryption Guide.
Remove a trusted master server

**Note:** Any trusted master servers at NetBackup version 8.0 or earlier must be removed using the NetBackup Administration Console.

You can remove a trusted master server, which removes the trust relationship between master servers. Note the following implications:

- Any replication operations fail that require the trust relationship.
- A remote master server is not included in any usage reporting after you remove the trust relationship.

**To remove a trusted master server**

1. Ensure that all replication jobs to the target master server are complete.
2. Delete all storage lifecycle policies (SLPs) that use the trusted master as a destination. Before deleting an SLP, ensure that there are no backup policies or protection plans that use the SLP for storage.
3. At the top, select **Settings > Global security**.
4. Select **Trusted master servers**.
5. Select **Actions > Remove**.
6. Click **Remove trust**.
7. Repeat step 3 through step 6 on the remote master server.
Creating and using API keys

This chapter includes the following topics:

- About API keys
- Manage API keys
- Use an API key with NetBackup REST APIs
- View API keys

About API keys

A NetBackup API key is a pre-authenticated token that identifies a NetBackup user to NetBackup RESTful APIs. The user can use the API key in an API request header when a NetBackup API requires authentication. NetBackup audits operations that are performed with that key with the full identity of the user.

More information

See “User identity in the audit report” on page 93.

See the NetBackup Security and Encryption Guide for information on using API keys with the \texttt{bpnbac} command.

Manage API keys

NetBackup users with permissions to manage API keys can use the NetBackup web UI to add, edit, delete, or view the keys that are associated with all NetBackup users. A NetBackup-authenticated user can view and manage their own API key using the NetBackup APIs, if that user does not have other RBAC permissions.
Add an API key

You can create API keys for authenticated NetBackup users (groups are not supported). A specific API key is only created one time and cannot be recreated. Each API key has a unique key value and API key tag.

Note: Only one API key can be associated with a specific user at a time. If a user requires a new API key, you must delete any active or any expired key for that user.

To add an API key

1. On the left, select Security > API keys.
2. In the upper-right corner, click Add.
3. Enter a User name for which you want to create the API key.
4. Indicate how long you want the API key to be valid, from today's date. NetBackup calculates the expiration date and displays it below.
5. Click Add.
6. To copy the API key, click Copy to clipboard.
   - Store this key in a safe place until you can deliver the key to the user. After you click Close, the key cannot be retrieved again. If this API key replaces a previous key for the user, the user must update any scripts, etc. to reflect the new API key.
7. Click Close.

Edit an API key

You can change the expiration date for an active API key. After an API key expires, a user's old key must be deleted and a new key created.

To edit an API key

1. On the left, select Security > API keys.
2. Select the API key and click Edit.
3. Note the current expiration date for the key and extend the date as wanted.
4. Click Save.

Delete an API key

You can delete an API key if you do not want a user to have access to the key or when it is no longer used. When you delete an API key, that key is permanently deleted. The associated user can no longer use that key for authentication or with the NetBackup APIs.
To delete an API key

1. On the left, select **Security > API keys**.
2. Select the API key and click **Delete > Delete**.

Use an API key with NetBackup REST APIs

After a key is created, the user can pass the API key in the API request headers. For example:

```
curl -X GET https://masterservername.domain.com/netbackup/admin/jobs/5 \
  -H 'Accept: application/vnd.netbackup+json;version=3.0' \
  -H 'Authorization: <API key value>'
```

View API keys

NetBackup security administrators or NetBackup users with permissions to view API keys can view the keys that are associated with all NetBackup users. A NetBackup-authenticated user can view and manage their own API key using the NetBackup APIs, if the user does not have RBAC permissions.

To view API keys

◆ On the left, select **Security > API keys**.
Configuring authentication options

This chapter includes the following topics:

- Sign-in options for the NetBackup web UI
- Configure user authentication with smart cards or digital certificates
- About Single Sign-On (SSO) configuration
- Configure NetBackup for Single Sign-On (SSO)
- Troubleshooting SSO

Sign-in options for the NetBackup web UI

NetBackup supports authentication of local domain users and Active Directory (AD) or LDAP domain users. AD and LDAP domains, smart card, and Single Sign-On (SSO with SAML) requires separate configuration for each master server domain where you want to use the authentication method.

NetBackup supports the following types of user authentication:

- User name and password
- Digital certificate or smart card, including CAC and PIV
  This authentication method only supports one AD or LDAP domain for each master server domain and is not available for local domain users.
  See “Configure user authentication with smart cards or digital certificates” on page 123.
- Single sign-on, with SAML
  Note the following requirements and limitations.
To use SSO, you must have a SAML 2.0 compliant identity provider configured in your environment.

Only one AD or LDAP domain is supported for each master server domain. This feature is not available for local domain users.

Configuration of the IDP requires the NetBackup APIs or the NetBackup command `nbidpcmd`.

API keys are used to authenticate a user or a group and cannot be used with SAML-authenticated users or groups.

Global logout is not supported.

Configure user authentication with smart cards or digital certificates

If not already completed as part of role-based access control (RBAC) configuration, ensure that you complete the following steps before you configure certificate authentication:

- Add the AD or the LDAP domains that are associated with your NetBackup users.
  See “Add AD or LDAP domains” on page 37.
- Configure RBAC for the NetBackup users.
  See “Configuring RBAC” on page 36.

To configure NetBackup to authenticate users with a smart card or digital certificate

1. At the top right, select **Settings > Smart card authentication**.
2. Turn on **Smart card authentication**.
3. Select a **User authentication domain**.
4. Select a **Certificate mapping attribute**.
5. Optionally, enter the **OCSP URI**.
   If you do not provide the OCSP URI, the URI in the user certificate is used.
6. Click **Save**.
7. To the right of **CA certificates**, click **Add**.
8. Browse for or drag and drop the CA certificates and click Add.
   Smart card authentication requires a list of trusted root or intermediate CA certificates. Add the CA certificates that are associated with the user digital certificates or the user smart cards.
   Certificate file types must be .crt, .cer, .der, .pem, or PKCS #7 format and less than 64KB in size.

9. On the Smart card authentication page, verify the configuration information.

10. Before users can use a digital certificate that is not installed on a smart card, the certificate must be uploaded to the browser’s certificate manager.
    See the browser documentation for instructions or contact your certificate administrator for more information.

11. When users sign in, they now see an option to Sign in with certificate or smart card.
    If you do not want users to have this sign-in option yet, turn off Smart card authentication. (For example, if all users do not yet have their certificates configured on their hosts.). The settings that you configured are retained even if you turn off smart card authentication.

Edit the configuration for smart card authentication

If the configuration changes for smart card authentication, you can edit the configuration details.

To edit user authentication configuration

1. At the top right, select Settings > Smart card authentication.
2. Click Edit.
3. Select a User authentication domain.
   Only the domains that are configured for NetBackup display in this list.
   See “Add AD or LDAP domains” on page 37.
4. Edit the Certificate mapping attribute.
5. Leave the OCSP URI field empty if you want to use the URI value from the user certificate. Or, provide the URI that you want to use.
Add or delete a CA certificate that is used for smart card authentication

Add a CA certificate

Smart card authentication requires a list of trusted root or intermediate CA certificates. Add the CA certificates that are associated with the user digital certificates or the user smart cards.

To add a CA certificate

1. At the top right, select Settings > Smart card authentication.
2. Click Add.
3. Browse for or drag and drop the CA certificates. Then click Add.

Certificate file types must be in DER, PEM, or PKCS #7 format and no more than 1 MB in size.

Delete a CA certificate

You can delete a CA certificate if it is no longer used for smart card authentication. Note that if a user attempts to use the associated digital certificate or smart card certificate, they are not able to sign in to NetBackup.

To delete a CA certificate

1. At the top right, select Settings > Smart card authentication.
2. Select the CA certificates that you want to delete.
3. Click Delete > Delete

Disable or temporarily disable smart card authentication

You can disable smart card authentication if you no longer want to use that authentication method for the master server. Or, if you need to complete other configuration before users can use smart cards.

To disable smart card authentication

1. At the top right, select Settings > Smart card authentication.
2. Turn off Smart card authentication.

The settings that you configured are retained even if you turn off smart card authentication.
About Single Sign-On (SSO) configuration

Starting from NetBackup 8.3, you can configure Single Sign-On (SSO) with any identity provider (IDP) that uses the SAML 2.0 protocol for exchanging authentication and authorization information. Note that you can configure an IDP with more than one Veritas product. For example, the same IDP can be configured with NetBackup and with APTARE.

Note the following requirements and limitations:

- To use SSO, you must have a SAML 2.0 compliant identity provider configured in your environment.
- Only identity providers that use AD or LDAP directory services are supported.
- Configuration of the IDP requires the NetBackup APIs or the NetBackup command `nbidpcmd`.
- SAML users cannot use the APIs. API keys are used to authenticate a user and therefore cannot be used with a SAML-authenticated user.
- Global logout is not supported.
Figure 9-1 Example NAT configuration: Identity provider in a private network

Configuring authentication options
About Single Sign-On (SSO) configuration
Configure NetBackup for Single Sign-On (SSO)

This section provides steps to set up trust and exchange configuration information between the IDP and the NetBackup master server. Before proceeding with the steps, ensure that the following prerequisites are met in your environment:

- An IDP is set up and deployed in your environment.
- The IDP is configured to authenticate domain users of Active Directory (AD) or Lightweight Directory Access Protocol (LDAP).
## Steps to configure NetBackup for Single Sign-On (SSO)

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1.   | Configure the Java keystore                                            | To establish a trust between the NetBackup master server and the IDP, add a SAML Java keystore (JKS) on the NetBackup master server.  
See “Configure the Java KeyStore” on page 130.                                                                 |
| 2.   | Download the IDP metadata XML file                                    | Download and save the IDP metadata XML file from the IDP.  
SAML metadata that is stored in XML files is used to share configuration information between the IDP and the NetBackup master server. The IDP metadata XML file is used to add the IDP configuration to the NetBackup master server. |
| 3.   | Add and enable the IDP configuration on the NetBackup master server   | See “Add and enable the IDP configuration” on page 132.                                                                                                                                                     |
| 4.   | Download the service provider (SP) metadata XML file                  | The NetBackup master server is the SP in the NetBackup environment. You can access the SP metadata XML file from the NetBackup master server by entering the following URL in your browser:  
https://<NB_Master_Server>/netbackup/sso/saml2/metadata  
Where <NB_Master_Server> is the IP address or host name of the NetBackup master server.                                                                 |
| 5.   | Enroll the NetBackup master server as a service provider (SP) with the IDP | See “Enroll the NetBackup master server with the IDP” on page 133.                                                                                                                                 |
| 6.   | Add SAML users and the SAML groups that use SSO to the necessary RBAC roles | SAML users and SAML user groups are available in RBAC only if the IDP is configured and enabled on the NetBackup master server. For steps on adding RBAC roles, see the following topic.  
See “Add a user to a role” on page 42.                                                                 |

After the initial setup, you can choose to enable, update, disable, or delete the IDP configuration.

See “Manage an IDP configuration” on page 134.
Configure the Java KeyStore

To establish a trust between the NetBackup master server and the IDP server, you must configure an SAML Java KeyStore (JKS) on the NetBackup master server. Depending on whether you are using the NetBackup CA or an external certificate authority (ECA), refer to either of the following sections:

---

**Note:** If you are using a combination of an ECA and NetBackup CA in your environment, by default, the ECA is considered while establishing trust with the IDP server.

---

**Configure a NetBackup CA JKS**

If you are using the NetBackup CA, create the NetBackup CA JKS on the NetBackup master server.

To create a NetBackup CA JKS

1. Log on to the NetBackup master server as root or administrator.

2. Depending on whether you are on a Windows or Linux operating system, run the `configureCerts` script as follows:

   - **On Windows:** `Installation_Path\wmc\bin\install\configureCerts.bat -configure_saml_cert_jks`
   - **On Linux:** `Installation_Path/wmc/bin/install/configureCerts -configure_saml_cert_jks`

   Where `Installation_Path` is the path where NetBackup is installed.

Once the NetBackup CA JKS is created, ensure that you update the NetBackup CA JKS every time the NetBackup CA certificate is renewed.

To renew the NetBackup CA JKS

1. Log on to the NetBackup master server as root or administrator.

2. Depending on whether you are on a Windows or Linux operating system, run the `configureCerts` script as follows:

   - **On Windows:** `Installation_Path\wmc\bin\install\configureCerts.bat -renew_saml_cert_jks`
   - **On Linux:** `Installation_Path/wmc/bin/install/configureCerts -renew_saml_cert_jks`

   Where `Installation_Path` is the path where NetBackup is installed.
3. Download the new SP metadata XML file from the NetBackup master server by entering the following URL in your browser:

https://<NBU_Master_Server>/netbackup/sso/saml2/metadata

Where `<NBU_Master_Server>` is the IP address or host name of the NetBackup master server.

4. Upload the new SP metadata XML file to the IDP. For steps on uploading the SP metadata XML file to the IDP, See "Enroll the NetBackup master server with the IDP" on page 133.

**Configure an ECA JKS**

If you are using an ECA, import the ECA JKS to the NetBackup master server.

---

**Note:** If you are using a combination of an ECA and the NetBackup CA in your environment, by default, the ECA is considered while establishing trust with the IDP server. To use the NetBackup CA, you must first remove the ECA JKS.

---

**To import an ECA JKS**

1. Log on to the master server as root or administrator.

2. Depending on whether you are on a Windows or Linux operating system, run the `configureSAMLECACert` script as follows:

   - **On Windows:**
     
     ```
     Installation_Path\wmc\bin\install\configureSAMLECACert.bat
     -addExternalCert -keystorefile <External JKS path>
     -keystorepassfile <Path to JKS password file>
     ```

   - **On Linux:**
     
     ```
     Installation_Path/wmc/bin/install/configureSAMLECACert
     -addExternalCert -keystorefile External JKS path
     -keystorepassfile JKS password file path
     ```

   Replace the variables as described below:

   - `Installation_Path` is the path where the product is installed.
   - `External JKS path` is the path to the ECA JKS file.
   - `JKS password file path` is the path to a file containing the password for the ECA JKS.

**To remove the ECA JKS**

1. Log on to the master server as root or administrator.

2. Depending on whether you are on a Windows or Linux operating system, run the `configureSAMLECACert` script as follows:
- On Windows: `Installation_Path\wmc\bin\install\configureSAMLECACert.bat - removeExternalCert`

- On Linux: `Installation_Path/wmc/bin/install/configureSAMLECACert - removeExternalCert`

Where `Installation_Path` is the path where the product is installed.

3 Download the new SP metadata XML file from the NetBackup master server by entering the following URL in your browser:

   https://<NBU_Master_Server>/netbackup/sso/saml2/metadata

   Where `<NBU_Master_Server>` is the IP address or host name of the NetBackup master server.

4 Upload the new SP metadata XML file to the IDP. For steps on uploading the SP metadata XML file to the IDP, See “Enroll the NetBackup master server with the IDP” on page 133.

Add and enable the IDP configuration

Before proceeding with the following steps, ensure that you have downloaded the IDP metadata XML file and saved it on the NetBackup master server.

To add and enable an IDP configuration

1 Log on to the master server as root or administrator.

2 Run the following command.

   `nbidpcmd -ac -n IDP configuration name -mxp IDP XML metadata file [-t SAML2] [-e true | false] [-u IDP user field] [-g IDP user group field] [-M Master Server]`

Replace the variables as described below:

- **IDP configuration name** is a unique name provided to the IDP configuration.

- **IDP XML metadata file** is the path to the XML metadata file, which contains the configuration details of the IDP in Base64URL-encoded format.

- `-e true | false` enables or disables the IDP configuration. An IDP configuration must be added and enabled, otherwise users cannot sign in with the Single Sign-On (SSO) option. Even though you can add multiple IDP configurations on a NetBackup master server, only one IDP configuration can be enabled at a time.
IDP user field and IDP user group field are the SAML attribute names, which are mapped to the userPrincipalName and the memberOf attributes of the AD or LDAP.

**Note:** Ensure that the SAML attribute names are defined in the format of `username@domainname` and `(CN=group name, DC=domainname)` respectively.

Master Server is the host name or IP address of master server to which you want to add or modify the IDP configuration. The NetBackup master server where you run the command is selected by default.

**For example:**
```
nbidpcmd -ac -n veritas_configuration -mxp file.xml -t SAML2 -e true -u username -g group-name -M master_server.abc.com
```

Enroll the NetBackup master server with the IDP

The NetBackup master server must be enrolled with the IDP as a service provider (SP). For step-by-step procedures that are specific to a particular IDP, see the following table:

<table>
<thead>
<tr>
<th>IDP name</th>
<th>Link to steps</th>
</tr>
</thead>
</table>

Enrolling an SP with an IDP typically involves the following operations:

**Uploading the SP metadata XML file to the IDP**

The SP metadata XML file contains the SP certificate, the entity ID, the Assertion Consumer Service URL (ACS URL), and a log out URL (SingleLogoutService). The SP metadata XML file is required by the IDP to establish trust, and exchange authentication and authorization information with the SP.
Mapping the SAML attributes to their AD or LDAP attributes

Attribute mappings are used to map SAML attributes in the SSO with its corresponding attributes in the AD or LDAP directory. The SAML attribute mappings are used for generating SAML responses, which are sent to the NetBackup master server. Ensure that you define SAML attributes that map to the userPrincipalName and the memberOf attributes in the AD or LDAP directory. The SAML attributes must adhere to the following formats:

<table>
<thead>
<tr>
<th>Corresponding AD or LDAP attribute</th>
<th>SAML attribute format</th>
</tr>
</thead>
<tbody>
<tr>
<td>userPrincipalName</td>
<td>username@domainname</td>
</tr>
<tr>
<td>memberOf</td>
<td>(CN=group name, DC=domainname)</td>
</tr>
</tbody>
</table>

Note: While adding the IDP configuration to the NetBackup master server, the values entered for the user (-u) and user group (-g) options must match the SAML attribute names that are mapped to the userPrincipalName and the memberOf attributes in the AD or LDAP. For more information, See “Add and enable the IDP configuration” on page 132.

Manage an IDP configuration

You can manage the identity provider (IDP) configurations on the NetBackup master server by using the enable (-e true), update (-uc), disable (-e false), and delete (-dc) options of the nbidpcmd command.

Enable an IDP configuration

By default, an IDP configuration is not enabled in the product environment. If you did not enable the IDP when you added it, you can use the -uc -e true options to update and enable the IDP configuration.

To enable an IDP configuration

1. Log on to the master server as root or administrator.
2. Run the following command:
   
   nbidpcmd -uc -n IDP configuration name -e true

   Where IDP configuration name is a unique name provided to the IDP configuration.
Note: Even though you can configure multiple IDPs on a NetBackup master server, only one IDP can be enabled at a time.

Update an IDP configuration

You can update the XML metadata file associated with an IDP configuration.

To update the IDP XML metadata file in an IDP configuration

1. Log on to the master server as root or administrator.
2. Run the following command:
   
   `nbidpcmd -uc -n IDP configuration name -mxp IDP XML metadata file`

   Replace the variables as described below:
   
   ■ *IDP configuration name* is a unique name provided to the IDP configuration.
   
   ■ *IDP XML metadata file* is the path to the XML metadata file, which contains the configuration details of the IDP in Base64URL-encoded format.

   If you want to update the IDP user or IDP user group values in an IDP configuration, you must first delete the configuration. The Single Sign-On (SSO) option is not available for users until you re-add the configuration with the updated IDP user or IDP user group values.

To update IDP user or IDP user group in an IDP configuration

1. Log on to the master server as root or administrator.
2. Delete the IDP configuration.
   
   `nbidpcmd -dc -n IDP configuration name`

   Where *IDP configuration name* is a unique name provided to the IDP configuration.

3. To add and enable the configuration again, run the following command:
   
   `nbidpcmd -ac -n IDP configuration name -mxp IDP XML metadata file
   [-t SAML2] [-e true | false] [-u IDP user] [-g IDP user group]
   [-M Master Server]`

   Replace the variables as described below:

   ■ *IDP configuration name* is a unique name provided to the IDP configuration.

   ■ *IDP XML metadata file* is the path to the XML metadata file, which contains the configuration details of the IDP in Base64URL-encoded format.
- `true` or `false` enables or disables the IDP configuration. An IDP must be available and enabled otherwise users cannot sign in with the Single Sign-On (SSO) option. Even though you can add multiple IDP configurations on a NetBackup master server, only one IDP configuration can be enabled at a time.

- **IDP user field** and **IDP user group field** are the SAML attribute names, which are mapped to the `userPrincipalName` and the `memberOf` attributes in the AD or LDAP.

---

**Note:** Ensure that the SAML attribute names are defined in the format of `username@domainname` and `(CN=group name, DC=domainname)` respectively.

---

**Master Server** is the host name or IP address of the master server to which you want to add or modify the IDP configuration. The NetBackup master server where you run the command is selected by default.

**Disable an IDP configuration**

If an IDP configuration is disabled in the product environment, the Single Sign-On (SSO) option of that IDP is not available for users when they sign in.

**To disable an IDP configuration**

1. Log on to the master server as root or administrator.
2. Run the following command:

   ```bash
   nbidpcmd -uc -n IDP configuration name -e false
   ```

   Where `IDP configuration name` is a unique name provided to the IDP configuration.

**Delete an IDP configuration**

If an IDP configuration is deleted, the Single Sign-On (SSO) option of that IDP is not available for users when they sign in.

**To delete an IDP configuration**

1. Log on to the master server as root or administrator.
2. Run the following command:

   ```bash
   nbidpcmd -dc -n IDP configuration name
   ```

   Where `IDP configuration name` is a unique name provided to the IDP configuration.
Troubleshooting SSO

This section provides steps for troubleshooting issues related to SSO.

Redirection issues

If you are facing issues with redirection, check the error messages in web services log files to narrow down the cause of the issue. NetBackup creates logs for the NetBackup web server and for the web server applications. These logs are written to the following location:

- **UNIX**: `/usr/openv/logs/nbwebservice`
- **Windows**: `install_path\NetBackup\logs\nbwebservice`

### NetBackup web UI does not redirect to the IDP sign in page

The IDP metadata XML file contains the IDP certificate, the entity ID, the redirect URL, and the logout URL. The NetBackup web UI can fail to redirect to the IDP sign in page, if the IDP XML metadata file is outdated or corrupted. The following message is added to the web service log:

```
Failed to redirect to the IDP server.
```

To ensure that the latest configuration details are available to the NetBackup master server, download the latest copy of the XML metadata file from the IDP. Use the IDP XML metadata file to add and enable the latest IDP configuration on the NetBackup master server. See “Add and enable the IDP configuration” on page 132.

### IDP sign in page does not redirect to the NetBackup web UI

When you enter your credentials in the IDP sign in page, your browser might display an **Authentication failed** error, instead of redirecting to the NetBackup web UI. Refer to the following table for resolution steps based on the error found in the web service log.

<table>
<thead>
<tr>
<th>Web Service Log Error message</th>
<th>Explanation and recommended action</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>userPrincipalName not found in response.</code></td>
<td>While adding the IDP configuration to the NetBackup master server, the value entered for the user (-u) option must match the SAML attribute name, which is mapped to the <code>userPrincipalName</code> attribute in AD or LDAP. For more information, See “Add and enable the IDP configuration” on page 132.</td>
</tr>
<tr>
<td>Web Service Log Error message</td>
<td>Explanation and recommended action</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>userPrincipalName is not in expected format</td>
<td>The IDP sends SAML responses to the NetBackup master server, which contains SAML user and SAML user group information. To enable the IDP to successfully send this information, ensure the value of userPrincipalName attribute sent by the IDP is defined in the format of <code>username@domainname</code>. For more information, See “Enroll the NetBackup master server with the IDP” on page 133.</td>
</tr>
</tbody>
</table>
| Authentication issue instant is too old or in the future | This error can occur because of the following reasons:  
- The date and time of IDP server and the NetBackup master server is not synchronized.  
- By default, the NetBackup master server allows a user to remain authenticated for a period of 24 hours. You might encounter this error, If an IDP allows a user to remain authenticated for a period longer than 24 hours. To resolve this error, you can update the SAML authentication lifetime of the NetBackup master server to match that of the IDP. Specify the new SAML authentication lifetime in the `<installpath>/var/global/wsl/config/web.conf` file on the NetBackup master server. For example, If your IDP has an authentication lifetime as 36 hours, update the entry in the `web.conf` file as follows: `SAML_ASSERTION_LIFETIME_IN_SECS=129600`. |
Table 9-4 (continued)

<table>
<thead>

</tbody>
</table>

Unable to sign in due to authorization-related issues

To sign in with SSO, you must add SAML users and the SAML user groups to the necessary RBAC roles. If the RBAC roles are not correctly assigned, you might encounter the following error while signing into NetBackup web UI.

You are not authorized to access this application. Contact your NetBackup security administrator to request RBAC permissions for the NetBackup web user interface.

Refer to the table below to troubleshoot authorization-related issues:

Table 9-5

<table>
<thead>
<tr>
<th>Cause</th>
<th>Explanation and recommended action</th>
</tr>
</thead>
<tbody>
<tr>
<td>RBAC roles are not assigned to the SAML users and the SAML groups.</td>
<td>After an IDP configuration is added and enabled on the NetBackup master server, ensure that necessary RBAC roles are assigned to SAML users and SAML user groups that use SSO. Note that SAML users and SAML user groups are available in RBAC only after the IDP configuration is added and enabled on the NetBackup master server. For steps on adding users, see “Add a user to a role” on page 42.</td>
</tr>
<tr>
<td>Cause</td>
<td>Explanation and recommended action</td>
</tr>
<tr>
<td>----------------------------------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RBAC roles are assigned to SAML users and SAML user groups associated with an IDP configuration that is not currently added and enabled.</td>
<td>When you add a SAML users or SAML user group in RBAC, the SAML user or SAML user group entry is associated with the IDP configuration that is added and enabled at that time. If you add and enable a new IDP configuration, ensure that you also add another entry for the SAML user or SAML user group. The new entry is associated with the new IDP configuration. For example, <strong>NBU_user</strong> is added to RBAC and assigned the necessary permissions, while an ADFS IDP configuration is added and enabled. If you add and enable an Okta IDP configuration, you must add a new user entry for <strong>NBU_user</strong>. Assign the necessary RBAC roles to the new user entry, which is associated with the Okta IDP configuration. For steps on adding users, See “Add a user to a role” on page 42.</td>
</tr>
<tr>
<td>RBAC roles are assigned to local domain users or Active Directory (AD) or LDAP domain users (instead of SAML users and SAML user groups).</td>
<td>SAML user or SAML user group records might appear similar to corresponding local domain users or AD or LDAP domain users already added in the RBAC. After an IDP configuration is added and enabled on the NetBackup master server, ensure that you add SAML users and SAML user groups in RBAC and assign the necessary permissions. Note that SAML users and SAML user groups are available in RBAC only after the IDP configuration is added and enabled on the NetBackup master server. For steps on adding SAML users and user groups, See “Add a user to a role” on page 42.</td>
</tr>
</tbody>
</table>
Table 9-5  (continued)

<table>
<thead>
<tr>
<th>Cause</th>
<th>Explanation and recommended action</th>
</tr>
</thead>
</table>
| The NetBackup master server is unable to retrieve user group information from the IDP | The IDP sends SAML responses to the NetBackup master server, which contains SAML user and SAML user group information. To enable the IDP to successfully send this information, ensure the following:  
  - The IDP is configured to authenticate domain users from AD or LDAP.  
  - The value of `memberOf` attribute sent by the IDP is in the X.500 distinguished format, that is, `{cn=groupname,dc=domain}`.  
  - While adding the IDP configuration to the NetBackup master server, the values entered for the user group (`-g`) option matches the SAML attribute name, which is mapped to the `memberOf` attribute in AD or LDAP. For more information, See “Add and enable the IDP configuration” on page 132. |
Managing hosts

This chapter includes the following topics:

■ View NetBackup host information
■ Approve or add mappings for a host that has multiple host names
■ Remove mappings for a host that has multiple host names
■ Reset a host's attributes

View NetBackup host information

The Hosts application contains details about the NetBackup hosts in your environment, including the master server, media servers, and clients. Only hosts with a host ID are displayed in this list. The Host name reflects the NetBackup client name of a host, also referred to as the primary name of the host.

Note: NetBackup discovers any dynamic IP addresses (DHCP or Dynamic Host Configuration Protocol hosts) and adds these addresses to a host ID. You should delete these mappings.

For host name-based certificates for 8.0 and earlier NetBackup hosts, refer to the respective version of the NetBackup Security and Encryption Guide.

To view NetBackup host information

1  On the left, select Security > Hosts.
   Review the security status and any other host names mapped to this host.

2  For additional details for this host, click the name of the host.
Approve or add mappings for a host that has multiple host names

A NetBackup host can have multiple host names. For example, both a private and a public name or a short name and a fully qualified domain name (FQDN). A NetBackup host may also share a name with other NetBackup host in the environment. NetBackup also discovers cluster names, including the host name and fully qualified domain name (FQDN) of the virtual name of the cluster.

The NetBackup client name of a host (or the primary name) is automatically mapped to its host ID during certificate deployment. For successful communication between NetBackup hosts, NetBackup also automatically maps all hosts to their other host names.

However, that method is less secure. Instead, you can choose to disable this setting and choose to manually approve the individual host name mappings that NetBackup discovers.

See “Disable automatic mapping of NetBackup host names” on page 112.

See the section called “Approve the host mappings that NetBackup discovers” on page 143.

See the section called “Map other host names to a host” on page 144.

See the section called “Map shared or cluster names to multiple NetBackup hosts” on page 144.

See the section called “Examples of auto-discovered mappings for a cluster” on page 145.

See the section called “Example of auto-discovered mappings for a cluster in a multiple NIC environment” on page 146.

See the section called “Examples of auto-discovered mappings for SQL Server environments” on page 146.

Approve the host mappings that NetBackup discovers

NetBackup automatically discovers many shared names or cluster names that are associated with the NetBackup hosts in your environment. Use the Mappings to approve tab to review and accept the relevant host names. When Automatically map host names to their NetBackup host ID is enabled, the Mappings to approve list shows only the mappings that conflict with other hosts.
Note: You must map all available host names with the associated host ID. If you deploy a certificate on a host using a host name that is not mapped with the associated host ID, NetBackup deploys a new certificate and issues a new host ID to the host as NetBackup considers it as a different host.

To approve the host names that NetBackup discovers
1. On the left, select Security > Hosts.
2. Click the Mappings to approve tab.
3. Click the name of the host.
4. Review the mappings for the host and click Approve if you want to use the discovered mapping.
   - Click Reject if you do not want to associate the mapping with the host.
   - The rejected mappings do not appear in the list until NetBackup discovers them again.
5. Click Save.

Map other host names to a host
You can manually map the NetBackup host to its host names. This mapping ensures that NetBackup can successfully communicate with the host using the other name.

To map a host name to a host
1. On the left, select Security > Hosts.
2. Select the host and click Manage mappings.
3. Click Add.
4. Enter the host name or IP address and click Save.
5. Click Close.

Map shared or cluster names to multiple NetBackup hosts
Add a shared or a cluster name mapping if multiple NetBackup hosts share a host name. For example, a cluster name.

Note the following before you create a shared or a cluster name mapping:
- NetBackup automatically discovers many shared names or cluster names. Review the Mappings to approve tab.
- If a mapping is shared between an insecure and a secure host, NetBackup assumes that the mapping name is secure. However, if at run-time the mapping resolves to an insecure host, the connection fails. For example, assume that
you have a two-node cluster with a secure host (node 1) and an insecure host (node 2). In this case, the connection fails if node 2 is the active node.

To map shared or cluster names to multiple NetBackup hosts

1. On the left, select **Security > Hosts**.
2. Select the host and click **Add shared or cluster mappings**.
3. Enter a **Shared host name or cluster name** that you want to map to two or more NetBackup hosts.

   For example, enter a cluster name that is associated with NetBackup hosts in your environment.
4. On the right, click **Add**.
5. Select the NetBackup hosts that you want to add and click **Add to list**.

   For example, if you entered a cluster name in step 3 select the nodes in the cluster here.
6. Click **Save**.

**Examples of auto-discovered mappings for a cluster**

For a cluster with hosts `client01.lab04.com` and `client02.lab04.com`, you may see the following entries. For each host, approve the mappings that are valid.

<table>
<thead>
<tr>
<th>Host</th>
<th>Auto-discovered mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>client01.lab04.com</td>
<td>client01</td>
</tr>
<tr>
<td>client01.lab04.com</td>
<td>clustername</td>
</tr>
<tr>
<td>client01.lab04.com</td>
<td>clustername.lab04.com</td>
</tr>
<tr>
<td>client02.lab04.com</td>
<td>client02</td>
</tr>
<tr>
<td>client02.lab04.com</td>
<td>clustername</td>
</tr>
<tr>
<td>client02.lab04.com</td>
<td>clustername.lab04.com</td>
</tr>
</tbody>
</table>

When you have approved all valid mappings, you see the **Mapped host or IP address** settings that are similar to the following entries.

<table>
<thead>
<tr>
<th>Host</th>
<th>Mapped Host Names/IP Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>client01.lab04.com</td>
<td>client01.lab04.com, client01, clustername, clustername.lab04.com</td>
</tr>
</tbody>
</table>
Example of auto-discovered mappings for a cluster in a multiple NIC environment

To perform backups of a cluster in a multi-NIC environment you must map the cluster node names to the virtual name of the cluster on the private network.

Table 10-1  Mapping host names for a cluster in a multi-NIC environment

<table>
<thead>
<tr>
<th>Host</th>
<th>Mapped Host Names/IP Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>client02.lab04.com</td>
<td>client02.lab04.com, client02, clustername, clustername.lab04.com</td>
</tr>
</tbody>
</table>

For example, for a cluster in a multi-NIC environment with hosts client01-bk.lab04.com and client02-bk.lab04.com, you may see the following entries. For each host, approve the mappings that are valid.

<table>
<thead>
<tr>
<th>Host</th>
<th>Auto-discovered Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>client01-bk.lab04.com</td>
<td>clusternam-bk.lab04.com</td>
</tr>
<tr>
<td>client02-bk.lab04.com</td>
<td>clusternam-bk.lab04.com</td>
</tr>
</tbody>
</table>

When you have approved all valid mappings, you see the Mapped host or IP address settings that are similar to the following entries.

<table>
<thead>
<tr>
<th>Host</th>
<th>Mapped Host Names/IP Addresses</th>
</tr>
</thead>
<tbody>
<tr>
<td>client01-bk.lab04.com</td>
<td>clusternam-bk.lab04.com</td>
</tr>
<tr>
<td>client02-bk.lab04.com</td>
<td>clusternam-bk.lab04.com</td>
</tr>
</tbody>
</table>

Examples of auto-discovered mappings for SQL Server environments

In Table 10-2, FCI is a SQL Server failover cluster instance. WSFC is Windows Server Failover Cluster.
<table>
<thead>
<tr>
<th>Environment</th>
<th>Host</th>
<th>Mapped Host Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>FCI (cluster with two nodes)</td>
<td>Physical name of Node 1</td>
<td>Virtual name of the SQL Server cluster</td>
</tr>
<tr>
<td></td>
<td>Physical name of Node 2</td>
<td>Virtual name of the SQL Server cluster</td>
</tr>
<tr>
<td>Basic or advanced availability group (primary and secondary)</td>
<td>Primary name</td>
<td>WSFC name</td>
</tr>
<tr>
<td></td>
<td>Secondary name</td>
<td>WSFC name</td>
</tr>
<tr>
<td>Basic or advanced availability group, with an FCI (primary FCI and secondary FCI)</td>
<td>Primary FCI name</td>
<td>WSFC name</td>
</tr>
<tr>
<td></td>
<td>Secondary FCI name</td>
<td>WSFC name</td>
</tr>
<tr>
<td></td>
<td>Physical name of Node 1</td>
<td>Virtual name of the SQL Server cluster</td>
</tr>
<tr>
<td></td>
<td>Physical name of Node 2</td>
<td>Virtual name of the SQL Server cluster</td>
</tr>
</tbody>
</table>

Remove mappings for a host that has multiple host names

You can remove any host name mappings that NetBackup added automatically or any host name mappings that you added manually for a host. Note that if you remove a mapping, the host is no longer recognized with that mapped name. If you remove a shared or a cluster mapping, the host may not be able to communicate with other hosts that use that shared or cluster name.

If you have issues with a host and its mappings, you can reset the host attributes. However, that resets other attributes like a host’s communication status. See “Reset a host’s attributes” on page 148.

To remove a host name that NetBackup discovers

1. On the left, select **Security > Hosts**.
2. Select the name of the host.
3  Click Manage mappings.

4  Locate the mapping you want to remove and click Delete > Save.

Reset a host's attributes

In some cases you need to reset a host's attributes to allow successful communication with the host. A reset is most common when a host is downgraded to a 8.0 or earlier version of NetBackup. After the downgrade, the master server cannot communicate with the client because the communication status for the client is still set to the secure mode. A reset updates the communication status to reflect the insecure mode.

When you reset a host's attributes:

- NetBackup resets the host ID to host name mapping information, the host's communication status and so on. It does not reset the host ID, host name, or security certificates of the host.

- The connection status is set to the insecure state. The next time the master server communicates with the host, the connection status is updated appropriately.

To reset the attributes for a host

1  On the left, select Security > Hosts.

2  Select the host and click Reset attributes > Reset.

3  Choose if you want to communicate insecurely with 8.0 and earlier hosts.

NetBackup can communicate with a 8.0 or earlier host when the Allow communication with NetBackup 8.0 and earlier hosts option is enabled in the Global Security Settings. This option is enabled by default.

Note: If you unintentionally use the Reset Host Attributes option, you can undo the changes by restarting the bpcd service. Otherwise, the host attributes are automatically updated with the appropriate values after 24 hours.
Troubleshooting the web UI

This chapter includes the following topics:

- Tips for accessing the NetBackup web UI
- If a user doesn’t have the correct permissions or access in the NetBackup web UI
- Unable to add AD or LDAP domains with the vssat command
- Unable to validate the user or group

Tips for accessing the NetBackup web UI

When NetBackup is properly configured, a user can access the master server at the following URL:

https://masterserver/webui/login

If the web UI on a master server does not display, follow these steps to troubleshoot the issue.

**Browser displays an error that the connection was refused or that it cannot connect to the host**

<table>
<thead>
<tr>
<th>Table 11-1</th>
<th>Solutions when the web user interface does not display</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step</strong></td>
<td><strong>Action</strong></td>
</tr>
<tr>
<td>Step 1</td>
<td>Check the network connection.</td>
</tr>
</tbody>
</table>
Table 11-1  Solutions when the web user interface does not display  
(continued)

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Verify that the firewall is open for port 443.</td>
<td>Refer to the following article: <a href="https://www.veritas.com/docs/100042950">https://www.veritas.com/docs/100042950</a></td>
</tr>
<tr>
<td>Step 3</td>
<td>If port 443 is in use, configure another port for the web UI.</td>
<td>Refer to the following article: <a href="https://www.veritas.com/docs/100042950">https://www.veritas.com/docs/100042950</a></td>
</tr>
<tr>
<td>Step 4</td>
<td>Verify that the nbwebservice is up.</td>
<td>Check the nbwebservice logs for more details.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Verify that the vnetd -http_api_tunnel service is running.</td>
<td>Verify that the vnetd -http_api_tunnel service is running. For more details, check the vnetd -http_api_tunnel logs with OID 491.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Ensure that the external certificate for the NetBackup web server is accessible and has not expired.</td>
<td>■ Use the Java Keytool commands to validate the following file: Windows: <code>install_path\var\global\wsl\credentials\nbwebservice.jks</code> UNIX: <code>/usr/openv/var/global/wsl/credentials nbwebservice.jks</code> ■ Check whether the nbwebgroup has a permission to access the nbwebservice.jks file. ■ Contact Veritas Technical Support.</td>
</tr>
</tbody>
</table>

**Cannot access web UI when you use a custom port**
- Restart the vnetd service.
- Follow the steps in Table 11-1.

**Certificate warning displays when you try to access the web UI**
The certificate warning displays if the NetBackup web server uses a certificate that is issued by a CA that is not trusted by the web browser. (Including the default NetBackup web server certificate that the NetBackup CA issued.)

**To resolve a certificate warning from the browser when you access the web UI**
1. Configure the external certificate for the NetBackup web server.
   See “Configure an external certificate for the NetBackup web server” on page 87.
2. If the problem persists, contact Veritas Technical Support.
If a user doesn't have the correct permissions or access in the NetBackup web UI

Note that only administrators, root users, or Enhanced Auditing users automatically have full access to the web UI. Other users must be configured in RBAC to have access and permissions for the web UI.

See “Configuring RBAC” on page 36.

If a user does not have the correct permissions or cannot access the workload assets that they should have access to, do the following:

- Verify that the user’s credentials match the user name (or the user name and domain name) that is specified in the user’s access rule.

- Review the access rules for the user in Security > RBAC. You may need to change the role permissions or object groups that are associated with those access rules. However, be aware that those kinds of changes also affect any other users that are associated with those roles or object groups.

- Any user account changes with the identity provider are not synchronized with the user’s access rules. If a user account changes with the identity provider, the user may not have the correct permissions or access. The NetBackup security administrator must edit each access rule for the user to remove the existing user account and re-add the new account.

- Changes to a user’s access rules are not immediately reflected in the web UI. A user with an active session must sign out and sign in again before any changes take effect.

Unable to add AD or LDAP domains with the vssat command

After you add an AD or LDAP domain, you can verify the configuration with the vssat validateprpl command and for groups with the vssat validategroup command. If a domain is not added successfully, the vssat validation displays The principal or group does not exist. More details are written to the nbatd logs.

Validation of an AD or LDAP user can fail for any of the following reasons:

- The connection cannot be established with the AD or LDAP server
- Incorrect user credentials were provided
- An incorrect user base DN or group base DN was provided
Multiple users or groups exist with the same name under the user base DN or the group base DN

The user or group does not exist

For information about the `vssat` command, see the NetBackup Commands Reference Guide.

Connection cannot be established with the AD or the LDAP server

If NetBackup could not establish a connection with the AD or the LDAP server, the `nbatd` logs contain the following error:

Example of error message:

```
(authldap.cpp) CAuthLDAP::validatePrpl - ldap_simple_bind_s() failed for user CN=Test User,OU=VTRSUsers,DC=VRTS,DC=com', error = -1, errmsg = Can't contact LDAP server,9:debugmsgs,1
```

LDAP server URL validation fails

The LDAP server URL (-s option) that is entered using the `vssat` `addldapdomain` command does not pass the validation test.

Validate the URL:

```
ldapsearch -H <LDAP_URI> -D "<admin_user_DN>" -w <passwd> -d <debug_level> -o nettimeout=<seconds>
```

Example of validation error message:

```
ldapsearch -H ldaps://example.veritas.com:389 -D "CN=Test User,OU=VTRSUsers,DC=VRTS,DC=com" -w ******** -d 5 -o nettimeout=60

TLS: can't connect: TLS error -8179:Peer's Certificate issuer is not recognized. ldap_sasl_bind(SIMPLE): Can't contact LDAP server (-1)
```

The server certificate issuer is not a trusted certificate authority (CA)

If you use the `ldaps` option you can validate the certificate issuer using the `ldapsearch` command.

Validate the certificate issuer:

```
set env var LDAFTP_TLS_CACERT to cacert.pem
```
ldapsearch -H <LDAPS_URI> -D "<admin_user_DN>" -w <passwd> -d <debug_level> -o nettimeout=<seconds>

Example of validation message:

- ldapsearch -H ldaps://example.veritas.com:389 -D "CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com" -w ******** -d 5 -o nettimeout=60

TLS: can't connect: TLS error -8179:
Peer's Certificate issuer is not recognized..ldap_sasl_bind(SIMPLE): Can't contact LDAP server (-1)

The file path for cacert.pem is:

- Windows:
  
  install_path\NetBackup\var\global\vxss\eab\data\systemprofile\certstore\trusted\pluggins\ldap\cacert.pem

- UNIX:
  
  /usr/openv/var/global/vxss/eab/data/root/.VRTSat/profile/certstore/trusted/pluggins/ldap/cacert.pem

The certificate authority (CA) that signed the LDAP server's security certificate is not in the nbatd trust store

Use the -f option of the vssat addldapdomain command to add the certificate to the nbatd command's truststore.

This option is necessary if the CA that signed the certificate is other than the following:

- Certification Services Division GeoTrust Symantec Corporation
- CyberTrust GlobalSign VeriSign Trust Network
- DigiCert RSA Security Inc.

User credentials are not valid

When you add an LDAP domain using the vssat addldapdomain and the user credentials are not valid, the nbatd logs contain the following error:
CAuthLDAP::validatePrpl - ldap_simple_bind_s() failed for user 'CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com', error = 49, errmsg = Invalid credentials,9:debugmsgs,1

Run the following command to validate the admin user DN and password:

```bash
ldapsearch -H <LDAP_URI> -D "<admin_user_DN>" -w <passwd> -d <debug_level> -o nettimeout=<seconds>
```

Example of message:

```bash
ldapsearch -H ldap://example.veritas.com:389 -D "CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com" -w ******** -d 5 -o nettimeout=60 ldap_bind: Invalid credentials (49)
```

An incorrect user base DN or group base DN was provided

If the user base DN (-u option) or the group base DN (-g option) is not correct, the nbatd logs contain the following error:

```bash
CAuthLDAP::validatePrpl - ldap_search_s() error = 10, errmsg = Referral,9:debugmsgs,1 CAuthLDAP::validatePrpl-ldap_search_s() error = 34, errmsg = Invalid DN syntax,9:debugmsgs,1
```

For example, run the following command:

```bash
ldapsearch -H ldap://example.veritas.com:389 -D "CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com" -w ***** -b "OU=VRTSUsers,DC=VRTS,DC=com" "(&(cn=test user)(objectClass=user))"
```

```bash
ldapsearch -H ldap://example.veritas.com:389 -D "CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com" -w ***** -b "VRTS" "(&(cn=test user)(objectClass=user))"
```

Multiple users or groups exist with the same name under user base DN or group base DN

To troubleshoot the issue

1. Check if the nbatd logs contain the following error:
2 Validate the number of matching entries for the existing base DN using the `ldapsearch` command:

```
ldapsearch -H <LDAP_URI> -D '<admin_user_DN>' -w <passwd>
-d <debug_level> -o nettimeout=<seconds> -b <BASE_DN> <search_filter>
```

This is applicable if user search attribute (-a option) and group search attribute (-y option) do not have unique values for the existing user base DN and group base DN respectively.

Example of validation message:

```
ldapsearch -H ldap://example.veritas.com:389 -D "CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com" -w *****
-b "DC=VRTS,DC=com" "(&(cn=test user)(objectClass=user))"
# LDAPv3 # base <DC=VRTS,DC=com> with scope subtree # filter: (cn=Test User) # requesting: ALL # Test User, VRTSUsers, VRTS.com dn: CN=Test User,OU=VRTSUsers,DC=VRTS,DC=com # Test User, RsvUsers, VRTS.com dn: CN=Test User,OU=RsvUsers,DC=VRTS,DC=com # numEntries: 2
```

User or group does not exist

To troubleshoot the issue

1 Check if the nbatd logs contain the following error:

```
CAuthLDAP::validatePrpl - user 'test user' NOT found, 9:debugmsgs,4
CAuthLDAP::validateGroup - group 'test group' NOT found, 9:debugmsgs,4
```

2 If a user or group exists in the LDAP domain, but the `vssat validateprpl` or the `vssat validategroup` command fails with this error, validate if the user or the group exists in the current base DNs (-u and -g options) using the following command.

```
ldapsearch -H <LDAP_URI> -D '<admin_user_DN>' -w <passwd>
-d <debug_level> -o nettimeout=<seconds> -b <BASE_DN> <search_filter>
```
Unable to validate the user or group

When the administrator configures the LDAP server, they must specify the `-d DomainName` option. DomainName can be the LDAP server name or the domain name. Whatever name is specified for `-d DomainName` is the domain name that an administrator should use when they add users to an RBAC role.

If you specify the incorrect domain, you may see the error `Unable to validate the user or group`. Review the following:

- The user name and domain name are typed correctly.
- You specified the correct domain name.
  
  The domain name that you should specify depends on how the LDAP server is configured in NetBackup. Contact your administrator for help with adding users to RBAC.
Managing storage and backups

- Chapter 12. Configuring storage
- Chapter 13. Managing protection plans
- Chapter 14. Managing protection plans for Microsoft SQL Server
- Chapter 15. Usage reporting and capacity licensing
Configuring storage

This chapter includes the following topics:

- About storage configuration
- Create a Media Server Deduplication Pool (MSDP) storage server
- Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server
- Create a disk pool
- Create a storage unit
- Create a universal share
- Using image sharing from the NetBackup Web UI
- Troubleshooting storage configuration
- Troubleshooting universal share configuration issues

About storage configuration

NetBackup lets you configure storage options for all protection plans and policies. You can configure storage options for the Media Server Deduplication Pool (MSDP), AdvancedDisk, Cloud storage, and OpenStorage options. You can also configure NetBackup to work with your universal shares.

You can set up the storage options using the storage option wizard. Access the wizard by clicking on Storage on the left side. The wizard guides you through the options for AdvancedDisk, Cloud storage, MSDP, and OpenStorage.
Note: If you use Key Management Service (KMS), it must be configured before you can select the KMS option in the storage server setup. Refer to NetBackup Security and Encryption Guide for more information.

To ensure that A.I.R and other storage capabilities are displayed accurately for the storage servers on the NetBackup web UI, upgrade the media server. You must upgrade the media server that has NetBackup versions 8.2 or earlier. After you upgrade the media server then use the command line to update the storage server.

Use the following command to update the storage server:

```
/usr/openv/netbackup/bin/admincmd/nbdevconfig -updatests -storage_server <storage server name> -stype PureDisk
```

For more information, refer to the NetBackup Deduplication Guide.

See “Create a Media Server Deduplication Pool (MSDP) storage server” on page 159.

See “Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server” on page 160.

See “Create a universal share” on page 165.

See “Create a disk pool” on page 162.

See “Create a storage unit” on page 164.

Create a Media Server Deduplication Pool (MSDP) storage server

Use this procedure to create a Media Server Deduplication Pool (MSDP) storage server. You have the option to create a disk pool (local storage or cloud storage) and storage unit after you create a storage server. The recommendation is that you create the disk pool and storage unit if they do not exist in NetBackup.

To add an MSDP storage server

1. On the left, click Storage and then click Add.
2. Select Media Server Deduplication Pool (MSDP) from the list.
3. In Basic properties, enter all required information and click Next.
   You must select your media server by clicking on the field. If you do not see the media server you want use, you can use Search to find it.
4. In Storage server options, enter all required information and click Next.
   If you use Key Management Service (KMS), it must be configured before you can select the KMS option.
5 (Optional) In Media servers, click Add to add any additional media servers you want to use.

Click Next after selecting additional media servers or if you want to continue without selecting additional media servers.

6 On the Review page, confirm that all options are correct and click Save.

If the MSDP storage server creation is unsuccessful, follow the prompts on the screen to correct the issue.

To configure MSDP to use cloud storage, use the following procedure (drop-down in Volumes step) to select an existing disk pool volume or create a new one.

See “Create a disk pool” on page 162.

7 (Optional) At the top, click on Createdisk pool.

8 (Optional) To create a cloud logical storage unit and disk pool with replication, click on Createdisk pool.

Enter the required information to create a disk pool.

In the next tab, select and add the required cloud volume. Select the cloud storage provider and the required details of the storage provider. Enter the credentials to access the cloud storage provider and then define the advanced settings.

Note: Currently, AWS S3 and Azure storage API types are supported.

For more information, refer to the NetBackup Cloud Administrator’s Guide and NetBackup Deduplication Guide.

See “Create a disk pool” on page 162.
See “Create a storage unit” on page 164.
See “Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server” on page 160.
See “Create a protection plan” on page 171.

Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server

Use the following procedures to create Cloud (Cloud Catalyst), OpenStorage, or an AdvancedDisk storage server.
Create a Cloud storage server

Follow this procedure to create a Cloud storage server.

To create a Cloud storage server

1. On the left, click Storage and then click Add.
2. Select Cloud storage from the list.
3. In Basic properties, enter all required information and click Next.
   - You must select your Cloud storage provider by clicking on the field. If you do not see the cloud storage provider you want use, you can use Search to find it.
   - If the Region information that you want to select does not appear in the table, use Add to manually add the required information. This option does not appear for every cloud storage provider.
   - The Deduplication option is enabled when you select a cloud storage provider that supports Cloud Catalyst.
   - You must select your media server by clicking on the field. If you do not see the media server you want use, you can use Search to find it.
4. In Access settings enter the required access details for the selected cloud provider and click Next.
   - If you use SOCKS4, SOCKS5, or SOCKS4A, some of the options in the Advanced section are not available.
   - If you create a Cloud Catalyst storage server, you have the option of encrypting data using MSDP KMS encryption.
5. In Storage server options, you can adjust the Object size, enable compression, or encrypt data and then click Next.
6. (Optional) In Media servers, click Add to add any additional media servers you want to use.
   - For Cloud and Cloud Catalyst storage servers, media servers with a NetBackup version older than master server are not listed.
   - Click Next after selecting additional media servers or if you want to continue without selecting additional media servers.
7. On the Review page, confirm that all options are correct and click Save.
8. (Optional) At the top, click on Create disk pool.

Create an OpenStorage storage server

Follow this procedure to create an OpenStorage storage server.
To create an OpenStorage storage server
1. On the left, click **Storage** and then click **Add**.
2. Select **OpenStorage** from the list.
3. In **Basic properties**, enter all required information and click **Next**.
   You must select your media server by clicking on the field. If you do not see the media server you want use, you can use **Search** to find it.
   Use the drop-down to select the correct **Storage server type**.
4. (Optional) In **Media servers**, click **Add** to add any additional media servers you want to use.
   Click **Next** after selecting additional media servers or if you want to continue without selecting additional media servers.
5. On the **Review** page, confirm that all options are correct and click **Save**.
   After you click **Save**, the credentials you entered are validated. If the credentials are invalid, click **Change** and you can correct the issue with the credentials.
6. (Optional) At the top, click on **Create disk pool**.

Create an AdvancedDisk storage server
Follow this procedure to create an AdvancedDisk storage server.

To create an AdvancedDisk storage server
1. On the left, click **Storage** and then click **Add**.
2. Select **AdvancedDisk** from the list.
3. Select a media server list and enter a **Storage server name** click **Select**.

See “Create a disk pool” on page 162.
See “Create a storage unit” on page 164.
See “Create a Media Server Deduplication Pool (MSDP) storage server” on page 159.
See “Create a protection plan” on page 171.

Create a disk pool
Use this procedure to create a disk pool after you create any type of storage server. You can create a disk pool at any time, but disk pool creation requires that you have an existing storage server created.

You can configure MSDP storage server to use cloud storage. To configure, you can select an existing cloud volume or create a new one when you create a disk
pool. Use the drop-down in Volumes step to select an existing cloud volume or create a new volume for the MSDP storage server.

When you view the Disk pools tab, the Available space column can be empty for a disk pool that uses a cloud storage provider. NetBackup cannot retrieve the information because the cloud provider does not supply an API for that information.

To create a disk pool

1. On the left, click Storage, click the Disk pools tab, and then click Add.

   Another way to create a disk pool is to click Create disk pool at the top of the screen after you have created a storage server.

2. In Disk pool options, enter all required information and click Next.

   Click Change to select a storage server.

   If Limit I/O streams is left cleared, the default value is Unlimited and may cause performance issues.

3. In Volumes, use the Volume drop down to select a volume or add a new volume. Enter all required information based on the selection and click Next.

   If you want to add a new disk pool volume, use the Add volume option.

4. In Replication, click Add to add replication targets to the disk pool.

   This step lets you select a trusted master server or add a trusted master server. You can add a trusted master server that supports NetBackup Certificate Authority (NBCA), ECA, and ECA together with NBCA.

   Replication is supported only on MSDP and Cloud Catalyst.

   Review all the information that is entered for the replication targets and then click Next.

5. On the Review page, verify that all settings and information are correct. Click Save.

   The disk pool creation and replication configuration continue in the background if you close the window. If there is an issue with validating the credentials and configuration of the replication, you can use the Change option to adjust any settings.

See “Create a storage unit” on page 164.

See “Create a Media Server Deduplication Pool (MSDP) storage server” on page 159.

See “Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server” on page 160.

See “Create a protection plan” on page 171.
Create a storage unit

Use this procedure to create a storage unit. You should create a storage unit after you create any type of storage server and disk pool. The steps in this procedure also work if you create a new storage unit without creating a storage server and disk pool.

When you view the Storage units tab, the Used space column can be empty for a storage unit that uses a cloud storage provider. NetBackup cannot retrieve the information because the cloud provider does not supply an API for that information.

To create a storage unit

1. On the left, click Storage, click the Storage units tab, and then click Add.
   
   Another way to create a storage unit is to click Create storage unit at the top of the screen after you have created a disk pool.

2. Select the storage unit from the list and click Start.

3. In Basic properties, enter all required information and click Next.

4. In Disk pool, select the disk pool you want to use in the storage unit and then click Next.

   The Enable WORM option is activated when you select a disk pool that supports WORM (Write Once Read Many) storage.

   For more information about WORM properties, refer to Configuring immutability and indelibility of data in NetBackup in the NetBackup Administrator’s Guide, Volume I guide.

   The On demand only option specifies whether the storage unit is available exclusively on demand. A policy or schedule must be explicitly configured to use this storage unit

5. In the Media server tab, select the media servers you want to use and then click Next.

   You can have NetBackup select your media server automatically or you can select your media servers manually using the radio buttons.

6. Review the setup of the storage unit and then click Save.

See “Create a disk pool” on page 163 on page 163.

See “Create a Media Server Deduplication Pool (MSDP) storage server” on page 159.

See “Create a Cloud (Cloud Catalyst), OpenStorage, or AdvancedDisk storage server” on page 160.

See “Create a protection plan” on page 171.
Create a universal share

A universal share offers the ability to ingest data directly into a space efficient SMB (CIFS) or NFS share. Space efficiency is achieved by storing the ingested data directly to an existing NetBackup deduplication pool (MSDP). No NetBackup software needs to be installed on the client that is mounting the share. Any operating system that is running a POSIX-compliant file system and can mount an SMB (CIFS) or NFS network share can write data to a universal share.

With the NetBackup web UI, you can:

■ Create, modify, view, and delete universal shares and manage them across appliances and build-your-own (BYO) servers.

**Note:** Universal shares created through NetBackup Appliance web GUI cannot be managed through NetBackup web UI. For NetBackup 8.3 and later, it is recommended to use the NetBackup web UI to manage universal shares on a NetBackup appliance.

■ Change the quota settings, Active Directory (AD) user and group names, and target hosts that pertain to the universal share.

**Note:** To create a policy for a universal share, use the NetBackup Java GUI. See the NetBackup Administrator's Guide, Volume I for more information about universal share policies.

### To create a universal share in the NetBackup web UI

1. On the left, click **Storage > Universal Share** and then click **Add**.

   If there are no storage servers, then configure an MSDP storage server:

   See “Create a Media Server Deduplication Pool (MSDP) storage server” on page 159.

   After you create the MSDP storage server, return to Universal Shares tab and click **Add** to add a universal share.

2. Provide the following required information:

   ■ Enter a **Display name**. This name does not need to be unique. Multiple universal shares can use the same display name.

   ■ Select the **Storage Server**.

   ■ Select the **Protocol**: NSF or SMB (CIFS)
Specify a Host that is allowed to mount the share and then click Add to list. You can use the host name, IP address, short name, or the FQDN to specify the Host. You can enter multiple hosts for each share.

3 At this point, continue to enter values in the remaining fields or click Save to save the universal share. You can update the remaining fields later from the universal share’s details page:

- Select a Quota type: Unlimited or Custom. If you select Custom, also specify the quota in MB, GB, or TB units. The Custom quota value limits the amount of data that is ingested into the share. Quotas are enforced using the front-end terabyte (FETB) calculation method. They are Implemented per share and can be modified at any time. You do not need to remount the share for the change to take effect.

To update the quote type or value from the universal share's details page, click Edit in the Quota section.

- Specify Active Directory user names and Active Directory group names. Only the specified users or groups can access the share. You can add and update the Active Directory user names and Active Directory group names later from the details page of an existing universal share.

Note: Currently Active Directory user names and Active Directory group names are supported only for the SMB (CIFS) protocol.

4 To view details about a universal share, click its name in the Universal Shares table.

5 To delete a universal share, select one or more and click Delete or select Delete from the action menu.

Deleting a universal share also deletes all data in the share. This action is irreversible and may take some time if the amount of data is large. Any active data transfers are immediately terminated, and any mounted shares are immediately removed.

Using image sharing from the NetBackup Web UI

You can use the NetBackup Web UI to share images from an on-premises location to the cloud. You can set up a cloud recovery host on demand and share the images to that server.

Use the information from the following topics from the NetBackup Deduplication Guide to set up a cloud recovery host:
About image sharing in cloud using Cloud Catalyst

About image sharing using MSDP cloud

Steps to complete from the NetBackup web UI after setting up the cloud recovery host

Before you begin, ensure that you have the required permissions in the web UI to import the image, restore, convert, and access the AMI ID.

Importing the images.

1. On the left, select Storage and then Disk pool.
2. Select the volume pools that contain the images that you want to share.
3. In the Disk pool options, click the hamburger menu beside the disk pool name and click Fast Import.

Note: The fast import option is an import operation that is specific to image sharing. You can import the backed-up images from the cloud storage to the cloud recovery host that is used for image sharing. After a fast import, you can restore the images. For AWS cloud provider, you can also convert the VM image to an AWS AMI.

4. In the Fast import images page, select the backup images that you want to import and click Import.
5. Verify the activity completion status in the Activity Monitor.

Converting the VM images to Amazon EC2 instance.

1. On the left select VMware and then select the imported VMware image to convert.
2. On the Recovery point tab, select the recovery date.
3. For the recovery point date, choose the required recovery point, click the hamburger menu, and select Convert.
4. Once the conversion is complete, an AMI ID is generated. In the Activity tab, look for the AMI ID column for the ID.
5. Use the AMI ID to locate the image in AWS and then use the AWS console to start the EC2 instance.
Troubleshooting storage configuration

The following table describes multiple issues that might occur when you configure storage:

<table>
<thead>
<tr>
<th>Error message or cause</th>
<th>Explanation and recommended action</th>
</tr>
</thead>
<tbody>
<tr>
<td>The following error is displayed when you create a disk pool for a cloud LSU: Disk is full</td>
<td>Workaround: Even if the disk is not full and you get the error, ensure that there is enough space available for creating the cloud LSU. By default the cloud LSU requires approximately 1 TB of free space. To reduce the cloud LSU size, open the contentrouter.cfg file from /msdp/etc/puredisk/ and change the values. After changing the values, restart the MSDP services and then create the cloud LSU.</td>
</tr>
<tr>
<td>The local MSDP storage does not display the compression and the encryption values correctly.</td>
<td>In the Select long-term retention storage configuration page for protection plans, the local MSDP storage does not display the compression and the encryption values correctly.</td>
</tr>
</tbody>
</table>

Troubleshooting universal share configuration issues

How to troubleshoot a failed installation or configuration

To configure a universal share, ensure that instant access is enabled on the storage server. For more information about instant access, see the following guides:

- NetBackup Web UI VMware Administrator’s Guide
- NetBackup Web UI Microsoft SQL Administrator’s Guide
To ensure that instant access is enabled on the storage server

1 Log in to the storage server and run the following command:
   
   /usr/openv/pdde/vpfs/bin/ia_byo_precheck.sh

2 Review the pre-condition checking results and the configuration results:
   
   /var/log/vpfs/ia_byo_precheck.log (for build your own (BYO) instant access only)
   /usr/openv/pdde/vpfs/vpfs-config.log (for both instant access and BYO)

In the following example, several required services are not running:

[root@rheinbu06 ~]# /usr/openv/pdde/vpfs/bin/ia_byo_precheck.sh
Mon Apr 13 12:42:14 EDT 2020 Try to get storagepath
Mon Apr 13 12:42:14 EDT 2020 Storage ContentRouter config path is
   /msdp/etc/puredisk/contentrouter.cfg
Mon Apr 13 12:42:14 EDT 2020 Storagepath is /msdp
Mon Apr 13 12:42:14 EDT 2020 File system for partition /msdp is 
   ext2/ext3
Mon Apr 13 12:42:14 EDT 2020 File system for partition /msdp/data is ext2/ext3
Mon Apr 13 12:42:14 EDT 2020 **** Hardware Virtualization not supported, Instant Access browse may be slow ****
Mon Apr 13 12:42:14 EDT 2020 **** system memory support 50 vpfs livemounts ****
Mon Apr 13 12:42:14 EDT 2020 **** nginx service required by Instant Access is not running ****
Mon Apr 13 12:42:14 EDT 2020 **** smb service required by Instant Access is not running ****
Mon Apr 13 12:42:14 EDT 2020 **** docker service required by VMware Instant Access is not running ****

3 Resolve the issues that are identified in the log. For example, restart any services that are required for instant access.
How to check for universal share capability

To ensure that the storage server has universal share capability

1. Make sure that the storage service is running NetBackup 8.3 or later.

2. Log on to the storage server and run the following command:
   
   `nbdevquery -liststs -U`

   Make sure that the InstantAccess flag is listed in the command’s output.
   
   If the flag is not listed, see one of the guides mentioned above to enable instant access on the storage server.

3. Run the following command:
   
   `nbdevconfig -getconfig -stype PureDisk -storage_server storage_server_name`

   Make sure that the UNIVERSAL_SHARE_STORAGE flag is listed in the command’s output.
   
   If the flag is not listed, create a universal share on the storage server:
   
   See “Create a universal share” on page 165.

How to restart a universal share

Whenever a universal share is created, a script is also created on the storage server. This script (/<msdp storage data path>/vpfs.mnt) can be used later to restart a universal share.

For example:

```
[root@rsvlmvc01vm309 vpfs.mnt]# mount | grep vpfs
vpfsd on /mnt/vpfs type fuse.vpfsd (rw,nosuid,nodev,relatime,user_id=0,group_id=0,default_permissions,allow_other)
vpfsd on /mnt/vpfs_shares/aa7e/aa7e83e5-93e4-57ea-a4a8-81ddbf5f819e
    type fuse.vpfsd (rw,nosuid,nodev,relatime,user_id=0,group_id=0,default_permissions,allow_other)
```

In this example, aa7e/aa7e83e5-93e4-57ea-a4a8-81ddbf5f819e is the universal share’s ID. This ID is found on the details page of the universal share in the NetBackup web UI: On the left, click **Storage > Universal Share** and then select the universal share to view its details.
Managing protection plans

This chapter includes the following topics:

- Create a protection plan
- Edit or delete a protection plan
- Subscribe an asset or an asset group to a protection plan
- Unsubscribe an asset from a protection plan
- View protection plan overrides
- About Backup Now
- About a NetBackup classic policy
- About policy management in the NetBackup web UI

Create a protection plan

A protection plan defines when backups are performed, how long the backups are retained, and the type of storage to use. Once you have set up a protection plan, you can subscribe assets to that protection plan. You can also configure access to the protection plan for your workload administrators before or after you configure the protection plan. To set up access, you need to configure roles in RBAC and then assign those roles to the protection plan.

Before you create a protection plan, you must configure all storage options. You can use the web UI to configure the OpenStorage, AdvancedDisk, Cloud storage, and MSDP storage options. Also, the web UI lets you configure a disk pool and a storage unit as well.

See “About storage configuration” on page 158.
For instructions on configuring protection plans for SQL Server, see the following topic:

- See “Create a protection plan to protect SQL Server assets” on page 183.

---

**Note:** After upgrade, the protection plans may not appear in the web UI. The conversion process may not have run but should run within 5 minutes of performing the upgrade.

---

**To create a protection plan**

1. On the left, click **Protection > Protection plans** and then click **Add**.

2. In **Basic properties**, enter a **Name**, **Description**, and select a **Workload** from the drop-down list.

   Optional selection:

   - **Policy name prefix**:
     Use this option for policy names. A prefix is appended to the policy name when NetBackup automatically creates a policy when users subscribe assets to this protection plan.

3. In **Schedules and retention**, click **Add**.

   You can set up a daily, weekly, or monthly backup and then set retention and replication of that backup. Also depending on workload, you can set up the following backup schedules: a **Automatic**, **Full**, **Differential incremental**, **Cumulative Incremental**, or **Snapshot only**.

   If you select **Monthly** as a frequency, you can select between **Days of the week** (grid view) or **Days of the month** (calendar view).

---

**Note:** If you select **Automatic** for the schedule type, then all schedules for this protection plan are **Automatic**. If you select a **Full**, **Differential incremental**, or **Cumulative Incremental** for the schedule type, then all schedules for this protection plan must be one of these options.

If you select **Automatic** for the schedule type, NetBackup automatically sets the schedule type for you. NetBackup calculates when to do a **Full** or **Differential incremental** based on frequency you specify.

---

In the **Attributes** tab:

- Select the **Backup type**, how often it runs, and how long to keep the backup for this schedule.
- The selections in the **Backup type** are dependent on workload that is selected and any other backup schedules that are currently active in this protection plan.

- (Optional) To replicate the backup, select **Replicate this backup**.
  - To use the **Replicate this backup** option, the backup storage must be a source in a targeted A.I.R. environment. The **Replication target** is configured in step 5.
  - For more information about replication, review *About NetBackup Auto Image Replication* in the *NetBackup Administrator’s Guide, Volume I*.

- (Optional) To keep a copy in long-term storage, turn on **Duplicate a copy immediately to long-term retention**.
  - NetBackup immediately duplicates a copy to long-term storage after the backup completes.
  - The schedule options that are available for long-term storage are based on the frequency and the retention levels for the regular backup schedules that you created.

In the **Start window** tab:

- Define a **Start day**, **Start time**, **End day**, and **End time** for this schedule using the options available on the screen. Or you can drag your cursor over the time boxes to create the schedule.

- Use the options on the right to duplicate, remove, or undo changes to a schedule.

Click **Save** after all options are selected in the **Attributes** and the **Start window** tabs.

Review the **Backup schedule preview** window and verify that all schedules are set correctly.

4 (Optional) If you have selected the **Cloud** workload, you can configure snapshot replication after you have configured a schedule and retention. For more information about cloud snapshot replication, see the *NetBackup Web UI for Cloud Administrator’s Guide*.

In the **Additional copies** column:

- Click **Configure Snapshot replication**.

- In the **Configure snapshot replica dialog**, click **Add**.

- Configure the **Retention** and select the **Destination** for the replicated snapshots.
Note: You can only create one additional cloud replication copy per protection plan.

If you selected Cloud as a workload, proceed to step 8.

5 In Storage options, configure the storage type per schedule you configured in step 3.

The options vary depending on storage options currently setup to work with NetBackup.

A protection plan can only use the storage that a NetBackup 8.1.2 or newer media server can access.

<table>
<thead>
<tr>
<th>Storage option</th>
<th>Requirements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Snapshot storage only</td>
<td>CloudPoint is required for this option.</td>
<td>Configure CloudPoint in the NetBackup Administration Console using the Snapshot Management Server feature. If you use the Snapshot only storage option, no other storage option can be selected. Go to step 6.</td>
</tr>
<tr>
<td>Perform snapshot backups</td>
<td>Microsoft SQL Server is required for this option.</td>
<td>For instructions on configuring protection plans for SQL Server, see the following topic:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- See “Create a protection plan to protect SQL Server assets” on page 183.</td>
</tr>
<tr>
<td>Backup storage</td>
<td>OpenStorage is required for this option. Tape, storage unit groups, and Replication Director not supported.</td>
<td>Click Edit to select the storage target. Click Use selected storage after selecting the storage target.</td>
</tr>
</tbody>
</table>

The NetBackup Accelerator feature allows protection plans to execute faster than traditional backups, by creating a compact data stream that uses less network bandwidth. If the storage server on the NetBackup master server supports NetBackup Accelerator, this feature is included in the protection plan. For more details on NetBackup Accelerator, contact the NetBackup administrator or see the NetBackup Administrator’s Guide, Volume I or the NetBackup for VMware Administrator’s Guide.

The Instant access feature allows the plan’s recovery points to support the creation of instant access VMs or databases.
Managing protection plans

Edit or delete a protection plan

### Storage option Requirements Description

**Replication target** The backup storage must be a source in a targeted A.I.R. environment.

Click **Edit** to select the replication target master server. Select a master server and then select a storage lifecycle policy. Click **Use selected replication target** to return to the storage options screen.

If the replication target master server is not in the list, you must add one in NetBackup. For more information on how to add a replication target master server, review *Adding a trusted master server* in the [NetBackup Deduplication Guide](http://example.com).

**Long-term retention storage** OpenStorage is required for this option. Tape, storage unit groups, and Replication Director not supported.

Click **Edit** to select the cloud storage provider. Click **Use selected storage** after selecting the cloud provider target.

**Transaction log options** Microsoft SQL Server is required for this option.

For instructions on configuring protection plans for SQL Server, see the following topic:

- See "Create a protection plan to protect SQL Server assets" on page 183.

6 In **Backup options**, configure all options based on your workload type. The options in this area change depending on workload option selected.

7 In **Permissions**, review the roles that have access to protection plans.

To give another role access to this protection plan, click **Add**. Select the **Role** in the table and customize the role by adding or removing permissions in the **Select permissions** section.

See "Configuring RBAC" on page 36.

8 In **Review**, verify that the protection plan details are correct and click **Save**.

---

### Edit or delete a protection plan

**Edit a protection plan**

You can make changes to the **Description** and the **Storage options** in a protection plan.
**Note:** You cannot edit the Schedules, Protected assets, or Advanced options after a protection plan is created. If you want to use different protection settings, you must create a new protection plan.

See “Create a protection plan” on page 171.

**To edit a protection plan**

1. On the left, click **Protection > Protection plans**.
2. Click on the protection plan name that you want to edit.
3. Click **Edit description** to edit the description.
4. (Optional) In the **Storage options** section, click **Edit** to change the storage options.

**Delete a protection plan**

You cannot delete a protection plan unless all assets have been removed from the protection plan. If you want to maintain protection on the assets, you must move them to another protection plan before you delete the current protection plan.

See “Unsubscribe an asset from a protection plan” on page 177.

See “Subscribe an asset or an asset group to a protection plan” on page 176.

**To delete a protection plan**

1. On the left, click **Protection > Protection plans**.
2. Select the check box next to the protection plan name.
3. On the top right, click **Delete**. Then click **Yes**.

See “Create a protection plan” on page 171.

---

**Subscribe an asset or an asset group to a protection plan**

You can subscribe a single asset or a group of assets to a protection plan. An asset or a group of assets can be subscribed to multiple protection plans. Before you can subscribe assets to a protection plan, you must create a protection plan.

**To subscribe an asset or an asset group to a protection plan**

1. On the left, click **Workloads** then the workload type (for example: VMware).
2. Select an asset type (for example: Virtual machines, Intelligent VM groups).
3. Select one or more assets.
4 Click **Add protection**.

If you selected a Cloud workload asset or asset group, proceed to step 7

5 In **Choose a protection plan**, select the name of the protection plan and click **Next**.

6 (Optional) Adjust any options in the **Backup options** or **Advanced sections**.

   - **Schedules**
     Change the backup start window for full or incremental schedules.
     For SQL Server transaction log schedules you can change the start window, the recurrence, and the retention period.

   - **Backup options**
     Adjust the backup options that were set up in the original protection plan.
     The options in this area change depending on workload.

   - **Advanced**
     Change or add any options that were set up in the original protection plan.

You need the following permissions to make these changes:

   - **Edit attributes**, to edit **Backup options** and **Advanced** options.

   - **Edit full and incremental schedules**, to edit the start window for these schedule types.

   - **Edit transaction log schedules**, to edit the settings for SQL Server transaction log schedules.

7 Click **Protect**.

See “Create a protection plan” on page 171.

---

**Unsubscribe an asset from a protection plan**

You can unsubscribe individual assets or groups of assets from a protection plan.

---

**Note:** When you unsubscribe an asset from a protection plan, there is a possibility that the asset displays **Classic policy** in the web UI. This situation can happen when an asset is subscribed to a protection plan and a backup runs for that asset. Then the asset is unsubscribed from the protection plan while it has a valid backup image. The web UI displays **Classic policy**, but there may or may not be an active policy protecting the asset.
To unsubscribe a single asset from a protection plan
1. On the left, click **Workloads** then the workload type (for example: **VMware**).
2. Select a single asset type (for example: **Virtual machines**).
3. Click on the specific asset name.
4. Click **Remove protection** and click **Yes**.

To unsubscribe a group of assets from the protection plan
1. On the left, click **Workloads** then the workload type (for example: **VMware**).
2. Select a group asset type (for example: **Intelligent VM groups**).
3. Click on the specific group asset name.
4. Click **Remove protection** and click **Yes**.

See “Create a protection plan” on page 171.
See "Edit or delete a protection plan" on page 175.

View protection plan overrides

When you set permissions for protection plans, you can set the permissions to allow your workload administrator to customize assets a protection plan covers. The workload administrator can apply overrides to certain areas of schedules and backup options for an asset.

To view protection plan overrides
1. On the left, click **Protection > Protection plans** and then click the name of the protection plan.
2. In the **Protected assets** tab, click on **Applied** in the **Custom settings** column.
3. Review the original and the new settings in the **Schedules** and **Backup options** tabs.
   - **Original**: The setting when the protection plan was first created.
   - **New**: The last change that was made to the protection plan for that setting.

About Backup Now

With Backup Now, workload administrators can back up an asset immediately. For example, you may use Backup Now to prepare for upcoming events that are outside scheduled backups, such as system maintenance. This type of backup is independent of scheduled backups and does not affect future backups. You can
manage and monitor a Backup Now job in the same way you manage and monitor other NetBackup jobs.

Backup Now is supported for the following workloads:

- VMware
- RHV
- Cloud
- Microsoft SQL

**Note:** You can select only one asset at a time for each Backup Now operation. Also, you must have permissions to subscribe to at least one protection plan to use Backup Now.

**To use Backup Now from the web UI**

1. Select the workload from the left.
2. Select the asset that you want to back up.
3. Click **Backup now** at the top of the table or select **Backup now** from the action menu in the asset’s row.
4. Choose a protection plan for the backup.
   
   All protection plans to which the asset is subscribed are listed.
   
   If you want to back up an asset that is not subscribed to any protection plan, you can select **Backup now** and choose from existing protection plans. You can also create a new protection plan and then use it with a **Backup now** operation.
5. Start the backup.

**To use Backup Now from an asset’s Details page**

- When you view an asset’s details, you can see all of the protection plans to which the asset is subscribed. You can choose **Backup now** from any one of the protection plans that are listed.

  If you want to back up an asset that is not subscribed to any protection plan, you can select **Backup now** and choose from existing protection plans. You can also create a new protection plan and then use it with a **Backup now** operation.
## About a NetBackup classic policy

You can protect an asset using a NetBackup classic policy, a protection plan, or both at the same time. This topic answers some common questions about NetBackup classic policies in the NetBackup web UI.

### Table 13-1 Classic policy FAQ

<table>
<thead>
<tr>
<th>Question</th>
<th>Answer</th>
</tr>
</thead>
<tbody>
<tr>
<td>In the web UI’s <strong>Protected by</strong> column, what does <strong>Classic policy only</strong> mean?</td>
<td>The asset is not currently subscribed to a protection plan. However, it was subscribed to a protection plan or covered by a classic policy at one time and it has a Last backup status. There may or may not be an active classic policy protecting the asset (contact the NetBackup administrator to find out).</td>
</tr>
<tr>
<td>Where can I find the details of a classic policy?</td>
<td>The details of a classic policy are not visible in the web UI. To manage a classic policy, a NetBackup administrator can use the NetBackup Administration Console or the NetBackup CLIs. Also, the NetBackup administrator or the backup admin can manage and create policies using the NetBackup APIs.</td>
</tr>
<tr>
<td>When should I subscribe an asset to a protection plan versus protecting the asset with a classic policy?</td>
<td>Only a NetBackup administrator can create a classic policy. If you do not have the required permissions to subscribe assets to protection plans, ask the backup administrator to configure the protection plan. The backup administrator may choose to protect the asset through a protection plan (web UI) or through a classic policy (Administration Console).</td>
</tr>
<tr>
<td>Can I use both a protection plan and a classic policy to protect an asset?</td>
<td>Yes. The web UI shows the details of the protection plan but not the details of the classic policy. You can contact the NetBackup administrator for the classic policy details.</td>
</tr>
<tr>
<td>What action should I take when an asset is unsubscribed from a protection plan and the web UI shows <strong>Classic policy only</strong> for that asset?</td>
<td>You can ask the NetBackup administrator if a classic policy protects the asset.</td>
</tr>
</tbody>
</table>
About policy management in the NetBackup web UI

The NetBackup web UI uses protection plans to protect the assets in your NetBackup environment. To manage classic policies you must use the NetBackup Administration Console. However, some policy types can also be managed in the NetBackup web UI:

- MS-Windows
- Standard
- Oracle
- MS-SQL-Server

See the following guides for details on these policies.

NetBackup Administrator's Guide, Volume I
NetBackup for Oracle Administrator's Guide
NetBackup for Microsoft SQL Server Administrator's Guide
Managing protection plans for Microsoft SQL Server

This chapter includes the following topics:

- About protecting SQL Server availability groups
- Create a protection plan to protect SQL Server assets
- Protect a SQL Server availability group that crosses NetBackup domains

About protecting SQL Server availability groups

NetBackup for SQL Server supports backups and restores of SQL Server Always On and read-scale availability groups. For information on supported versions and environments, see the Application/Database Agent Compatibility List.

You can protect an availability group environment in the following ways:

- With a protection plan that protects the preferred or the primary replica.
- If an availability group crosses multiple NetBackup domains, you can use Auto Image Replication (A.I.R.) to replicate the backup to the other NetBackup domains.
  See “Protect a SQL Server availability group that crosses NetBackup domains” on page 191.

Note the following before you configure the protection plan:

- NetBackup can only fully protect the availability group environment if each replica on which backups occur is registered with credentials.
- NetBackup runs a backup job on each replica in the availability group. On the replicas which are not the backup source, the job skips the backup.
Limitations

Note the following limitations for backups of availability groups:

- NetBackup does not support the following types of backups for availability databases:
  - Backups of filegroups or files
  - VMware backups
  - A grouped snapshot backup
  - Backups of non-readable secondary replicas
    NetBackup can only back up databases in a replica when you allow user connections for the replica.
    If a secondary replica is the preferred replica and it is non-readable, the backup fails. If a secondary replica is not the preferred replica, NetBackup skips the backup of that replica.

SQL Server does not support the following types of backups on a secondary replica:

- Full backups
  If a full backup takes place on a secondary replica, NetBackup converts the full backup to a copy-only backup.

- Differential backups
  Backups of this type result in a failed backup.

- Copy-only transaction log backups
  Backups of this type result in a failed backup.

Create a protection plan to protect SQL Server assets

You can create a protection plan to perform scheduled backups of SQL Server assets.

To create a protection plan to protect SQL Server assets

1. On the left, click Protection > Protection plans and then click Add.

2. In Basic properties, enter a Name, Description, and select Microsoft SQL Server from the Workload list.

   (Optional) Add a policy name prefix. A prefix is appended to the policy name when NetBackup automatically creates a policy when users subscribe assets to this protection plan.
In Schedules and retention, click Add.

You can the frequency and the retention backup. You can set up the following backup schedules: Full, Differential incremental, or Transaction log.

In the Attributes tab:

- Select the Backup type, how often it runs, and how long to keep the backup for this schedule.

In the Start window tab:

- Define a Start day, Start time, End day, and End time for this schedule using the options available on the screen. Or you can drag your cursor over the time boxes to create the schedule.

- Use the options on the right to duplicate, remove, or undo changes to a schedule.

Click Save after all options are selected in the Attributes and the Start window tabs.

Review the Backup schedule preview window and verify that all schedules are set correctly.
In Storage options, configure the storage type per schedule you configured in step 3.

The options vary depending on storage options currently setup to work with NetBackup.

A protection plan can only use the storage that a NetBackup 8.1.2 or newer media server can access.

<table>
<thead>
<tr>
<th>Storage option</th>
<th>Requirements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform snapshot backups</td>
<td></td>
<td>Performs a point-in-time, read-only, disk-based copy of a client volume. NetBackup back up data from the snapshot, not directly from the client’s primary or original volume. Snapshots cannot be used to perform differential backups or transaction log backups. In those cases NetBackup performs a stream-based backup. You can select from the following methods: Automatic, VxVM, or VSS. See “Snapshot methods” on page 190. Note that SQL Server dynamic file allocation can reduce the likelihood that any of the component files contain large areas of empty space. Also see the NetBackup for Microsoft SQL Server Administrator’s Guide for details on the factors that can influence backup performance.</td>
</tr>
<tr>
<td>Backup storage</td>
<td>OpenStorage is required for this option. Tape, storage unit groups, and Replication Director not supported.</td>
<td>Click Edit to select the storage target. Click Use selected storage after selecting the storage target.</td>
</tr>
<tr>
<td>Transaction log options</td>
<td></td>
<td>When you configure a transaction log schedule, you can choose to use the same storage that is used for database backups. Or, you can choose unique storage for transaction logs.</td>
</tr>
</tbody>
</table>

5 In Backup options, configure the options that you want.

Note: For availability groups, ensure that you select a Availability database backup preference setting for databases and for transaction logs.

See “Performance tuning and configuration options” on page 186.
6 In Permissions, review the roles that have access to the protection plan.

To give another role access to this protection plan, click Add. Select the Role in the table and customize the role by adding or removing permissions in the Select permissions section.

See “Configuring RBAC” on page 36.

7 In Review, verify that the protection plan details are correct and click Save.

Schedules and retention

When you have the necessary RBAC permissions, you can adjust the following settings when you subscribe an asset to a protection plan.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recurrence (frequency)</td>
<td>Note: This setting can only be edited for Microsoft SQL Server transaction log schedules. How frequently or when to run the backup.</td>
</tr>
<tr>
<td>Keep for (retention)</td>
<td>Note: This setting can only be edited for Microsoft SQL Server transaction log schedules. How long to keep the files that were backed up by the schedule.</td>
</tr>
<tr>
<td>Backup start window</td>
<td>Set the window during which a backup can start.</td>
</tr>
</tbody>
</table>

Performance tuning and configuration options

When you have the necessary RBAC permissions, you can adjust the following settings when you subscribe an asset to a protection plan.
### Table 14-2  Performance tuning and configuration options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client buffers per stripe</td>
<td>(Stream-based backups only) This option affects buffer space availability. NetBackup uses this parameter to decide how many buffers to allocate for reading or writing each data stream during a backup operation. By allocating a greater number of buffers, you can affect how quickly NetBackup can send data to the NetBackup master server. The default value for this option is 2, which allows double buffering. You may get slightly better performance by increasing this value to a higher value. Range is 1–32.</td>
</tr>
<tr>
<td>Maximum transfer size</td>
<td>(Stream-based backups only) This option is the buffer size used by SQL Server for reading and writing backup images. Generally, you can get better SQL Server performance by using a larger value. This option can be set for each backup operation. Calculated as 64 KB * $2^\text{MAX_TRANSFER_SIZE}$. It ranges in size from 64 KB to 4 MB. The default is 4 MB.</td>
</tr>
<tr>
<td>Parallel backup operations</td>
<td>This option is the number of backup operations to start simultaneously, per database instance. Range is 1–32. The default is 1.</td>
</tr>
<tr>
<td>VDI timeout (seconds)</td>
<td>Determines the time-out interval for SQL Server Virtual Device Interface. The selected interval is applied to backups and restores of databases and of transaction logs. The default value for backups is 300. The default value for restore jobs is 600. Range is 300–2147483647.</td>
</tr>
<tr>
<td>Use Microsoft SQL Server compression</td>
<td>Enable this option to use SQL Server to compress the backup image. If you enable SQL Server compression, do not enable NetBackup compression. SQL Server compression is not supported for snapshot backups.</td>
</tr>
<tr>
<td>Skip unavailable (offline, restoring, etc.) databases</td>
<td>NetBackup skips any database with a status that prevents NetBackup from successfully backing up the database. These statuses include offline, restoring, recovering, and emergency mode, etc. NetBackup skips the backup of the unavailable database, but continues with the backup of the other databases that are subscribed to the protection plan. The backup completes with a status 0 and the job details indicate that the database was skipped.</td>
</tr>
<tr>
<td>Create copy-only backup</td>
<td>This option allows SQL Server to create an out-of-band backup so that it does not interfere with the normal backup sequence.</td>
</tr>
</tbody>
</table>
Table 14-2  Performance tuning and configuration options (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform Microsoft SQL Server checksum</td>
<td>Choose one of the following options for SQL Server backup checksums:</td>
</tr>
<tr>
<td></td>
<td>■ None. Disables the backup checksums.</td>
</tr>
<tr>
<td></td>
<td>■ To verify the checksums before the backup, choose one of the following options. Note that these options impose a performance penalty on a backup or restore operation.</td>
</tr>
<tr>
<td></td>
<td>■ Continue on error. If the backup encounters a verification error, the backup continues.</td>
</tr>
<tr>
<td></td>
<td>■ Fail on error. If the backup encounters a verification error, the backup stops.</td>
</tr>
<tr>
<td>Convert incremental backup to full backup</td>
<td>If no previous full backup exists for the database, then NetBackup converts a differential backup to a full backup.</td>
</tr>
<tr>
<td></td>
<td>The agent determines if a full backup exists for each database. If no previous full backup exists, a differential backup is converted to a full as follows:</td>
</tr>
<tr>
<td></td>
<td>■ If you select a database for a differential backup, the backup is converted to a full database backup.</td>
</tr>
<tr>
<td></td>
<td>■ For snapshot backup policies, a Full schedule must exist to successfully convert differential backups to full backups.</td>
</tr>
<tr>
<td></td>
<td>Note: NetBackup only converts a differential backup if a full backup was never performed on the database. If a full backup does not exist in the NetBackup catalog but SQL Server detects an existing full LSN, NetBackup performs a differential backup and not a full. In this situation, you can restore the full backup with native tools and any differentials with the NetBackup MS SQL Client. Or, if you expired the backup in NetBackup, you can import the full backups into the NetBackup catalog. Then you can restore both the full and the differential backups with the NetBackup MS SQL Client.</td>
</tr>
<tr>
<td>Convert transaction log backup to full backup</td>
<td>If no previous full backup exists for the database, then NetBackup converts a transaction backup to a full backup.</td>
</tr>
<tr>
<td></td>
<td>This option also detects if a full recovery database was switched to the simple recovery model and back to the full recovery model. In this scenario, the log chain is broken and SQL Server requires a differential backup before a subsequent log backup can be created. If NetBackup detects this situation, the backup is converted to a differential database backup.</td>
</tr>
<tr>
<td></td>
<td>Note: NetBackup only converts a transaction log backup if a full backup was never performed on the database. If a full backup does not exist in the NetBackup catalog but SQL Server detects an existing full LSN, NetBackup performs a transaction log backup and not a full. In this situation, you can restore the full backup with native tools and any differentials and log backups with the NetBackup MS SQL Client. Or, if the backup is expired, you can import the full backups into the NetBackup catalog. Then you can restore the full, differential, and log backups with the NetBackup MS SQL Client.</td>
</tr>
</tbody>
</table>
### Table 14-2  Performance tuning and configuration options (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability database backup preference</td>
<td>This option determines where backups of availability groups occur. Ensure that you select a setting for databases and a setting for transaction logs.</td>
</tr>
</tbody>
</table>
| ■ None | Perform the backup on the specified instance. Use this option when you intend to protect individual availability databases.  
**Note:** Do not select this option if you intend to protect availability groups. |
| ■ Protect primary replica | Backups always occur on the primary replica. This option applies to availability replicas and to instances that have both standard databases and availability databases. |
| ■ Protect preferred replica | Honors your SQL Server backup preferences. These preferences include the preferred replica, backup priority, and excluded replicas. Note that NetBackup initiates a backup job on each replica. The backup is skipped on any replica that isn’t the intended backup source. This option applies to availability replicas and to instances that have both standard databases and availability databases. |
| ■ Skip availability databases | Skips any availability databases on the instance. Use this option when you intend to protect any instances that contain both standalone databases and availability databases and only want to protect the standalone databases.  
**Note:** Do not select this option if you intend to protect availability groups. |
| Backup preference for individual availability databases | Note the following behavior when you select a protection plan to protect individual availability databases. |
| ■ If the preference for Databases is set to Skip availability databases, scheduled backups cannot succeed. Databases must have the setting None, Protect preferred replica, or Protect primary replica.  
When a user selects Backup now to back up an availability database, the backup is performed on the selected node. The image is cataloged under the cluster name. |
| Truncate logs after backup | This option backs up the active part of the transaction log and then marks it inactive or empty. This option is enabled by default. |

### Using copy-only snapshot backups to affect how differentials are based

When you use both full backups and snapshot backups to protect SQL Server, the previous snapshot backup expires after the next snapshot backup is created. If you
require a point in time restore before the latest backup, the differentials are based on a snapshot backup that no longer exists. Alternatively, NetBackup lets you create copy-only backups that are out-of-band so the backup does not reset the differential baseline. Differential backups are then based on the last full backup.

If a failure occurs and is detected immediately, you can restore the last full backup. Then you can replay the necessary transaction logs to achieve recovery. However, if a failure is not detected until after the next full backup, then there are no snapshot backups available to restore (see Figure 14-1). When you use copy-only backups, each differential is instead based on the last full backup that is not copy-only. You can restore the last full backup, restore the latest differential backup, then restore the necessary transaction log backups before the error occurred.

**Figure 14-1**  Recovering after an error when using full and copy-only backups

Transaction logs

**Snapshot methods**

The following snapshot methods and options are available for snapshot backups. For more details see the [NetBackup Snapshot Client Administrator’s Guide](#).

**Table 14-3**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic</td>
<td>NetBackup selects a snapshot method when the backup starts. If necessary, NetBackup selects a different method for assets in the protection plan.</td>
</tr>
</tbody>
</table>
Table 14-3  (continued)

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VSS</td>
<td>VSS uses the Volume Shadow Copy Service of Windows. VSS is for local backup and it selects the actual snapshot method depending on which snapshot provider is configured on the client. Provider type:</td>
</tr>
<tr>
<td></td>
<td>■ Automatic. NetBackup selects the available provider in this order: Hardware, Software, System.</td>
</tr>
<tr>
<td></td>
<td>■ System. Use the Microsoft system provider for a block-level copy on write snapshot.</td>
</tr>
<tr>
<td></td>
<td>■ Use the software provider to intercept the I/O requests at the software level between the file system and the volume manager.</td>
</tr>
<tr>
<td></td>
<td>■ Use the hardware provider for your disk array.</td>
</tr>
<tr>
<td></td>
<td>Snapshot attribute:</td>
</tr>
<tr>
<td></td>
<td>■ Automatic. NetBackup selects the attribute.</td>
</tr>
<tr>
<td></td>
<td>■ Differential. Use a copy-on-write type of snapshot.</td>
</tr>
<tr>
<td></td>
<td>■ Plex. Use a clone or a mirror type of snapshot.</td>
</tr>
<tr>
<td>VxVM</td>
<td>For any snapshots with any data that is configured over Volume Manager volumes.</td>
</tr>
<tr>
<td></td>
<td>■ Resynchronize mirror in background. Select this option to allow more efficient use of backup resources. If two backups need the same tape drive, the second can start even though the resynchronize operation for the first job has not completed.</td>
</tr>
<tr>
<td></td>
<td>■ Wait for mirror sync completion. Select this option if full-sized instant snapshots are not available for backup until the mirror synchronization is complete. If the backup starts before the snapshot disks are fully synchronized with the source and the server does not have access to the source disks, then the backup fails.</td>
</tr>
<tr>
<td></td>
<td>■ Maximum number of volumes to resynchronize. The number of volume pairs that are resynchronized simultaneously. Accept the default if the I/O bandwidth in your clients and disk storage cannot support simultaneous synchronization of volumes. For the configurations that have sufficient I/O bandwidth, multiple volumes can be resynchronized simultaneously, to complete resynchronization sooner. A major factor in I/O bandwidth is the number and speed of HBAs on each client.</td>
</tr>
</tbody>
</table>

Protect a SQL Server availability group that crosses NetBackup domains

When you have an availability group that crosses NetBackup domains, you can use Auto Image Replication (A.I.R.) to replicate backup images to another NetBackup domain. The following configuration requirements exist:

■ Configure the storage in the NetBackup source and target domains:
  ■ For OpenStorage, a disk appliance of the same type in each domain. The disk appliance type must support NetBackup Auto Image Replication (A.I.R.).
For NetBackup deduplication, the storage that NetBackup can use for a Media Server Deduplication Pool in each domain.

Configure the domain where the backups occur as the source domain. Then configure the domain where you want to restore the backups as the target domain.

To create a protection plan to protect a Microsoft SQL Server availability group that crosses domains

1. On the left, click Protection > Protection plans and then click Add.
2. In Basic properties, enter a Name and Description.
3. From the Workload list, select Microsoft SQL Server.
4. In Schedules and retention, click Add.
   You can set up a full, differential, or transaction log backup.
   In the Attributes tab:
   - Select the Backup type, how often it runs, and how long to keep the backup for this schedule.
   - Select Replicate this backup.
     - The backup storage must be a source in a targeted A.I.R. environment. The Replication target is configured in step 5.
     - For more information about replication, review About NetBackup Auto Image Replication in the NetBackup Administrator’s Guide, Volume I.

In the Start window tab:

- Define a start window for this schedule using the options available on the screen. You can add multiple schedule windows for this schedule if needed.

Review the Backup schedule preview and verify that all schedules are set correctly.
5 In Storage options, configure the storage type per schedule you configured in step 5.

A protection plan can only use the storage that a NetBackup 8.1.2 or newer media server can access.

<table>
<thead>
<tr>
<th>Storage option</th>
<th>Requirements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backup storage</td>
<td>OpenStorage is required for this option. Tape, storage unit groups, and Replication Director not supported.</td>
<td>Click Edit to select the storage target. Click Use selected storage after selecting the storage target.</td>
</tr>
<tr>
<td>Replication target</td>
<td>The backup storage must be a source in a targeted A.I.R. environment.</td>
<td>Click Edit to select the replication target master server. Select a master server and then select a storage lifecycle policy. Click Use selected replication target to return to the storage options screen.</td>
</tr>
</tbody>
</table>

6 In Backup options, select the options that you want.

From the Availability database backup preference list, choose one of the following:

- Protect primary replica
- Protect preferred replica

See “Performance tuning and configuration options” on page 186.

(Optional) Make any other changes to the tuning parameters.

7 In Permissions, review the roles that have access to this protection plan.

8 In Review, verify that the protection plan details are correct and click Finish.

NetBackup Administrator’s Guide, Volume I
NetBackup Deduplication Guide
NetBackup OpenStorage Solutions Guide
http://www.netbackup.com/compatibility
Usage reporting and capacity licensing

This chapter includes the following topics:

- Track backup data size on your master servers
- Configure the servers list for usage reporting
- Scheduling reports for capacity licensing
- Other configuration for incremental reporting
- Troubleshooting failures for nbdeployutil and incremental reporting

Track backup data size on your master servers

The Usage reporting application lists the size of the backup data for the NetBackup master servers in your organization. This reporting provides the following benefits:

- Ability to plan for capacity licensing.
- On a weekly basis, NetBackup gathers and reports usage and trend information. The nbdeployutil utility has scheduled runs to gather data for the report (enabled by default). For more information, see Scheduling capacity licensing reports.
- A link to Smart Meter. This tool allows NetBackup customers to proactively manage their license use through near real-time visibility of consumption patterns.
- Reporting for the following policy types.

<table>
<thead>
<tr>
<th>BigData</th>
<th>Informix</th>
<th>NDMP</th>
<th>Sybase</th>
</tr>
</thead>
<tbody>
<tr>
<td>MS-Exchange-Server</td>
<td>MS-SQL-Server</td>
<td>Oracle</td>
<td>VMware</td>
</tr>
</tbody>
</table>
Requirements

NetBackup automatically collects data for the usage reporting, provided the following requirements are met:

- The master server (or master servers) are at NetBackup 8.1.2 or later.
- You use capacity licensing.
- You use automatic, scheduled reports. If you manually generate capacity license reports, the data does not display in the usage report in the NetBackup web UI.
- The following file exists:
  - UNIX: /usr/openv/var/global/incremental/Capacity_Trend.out
  - Windows: install_path\var\global\incremental\Capacity_Trend.out
- If you want one of your master servers to gather usage reporting data for other remote master servers, additional configuration is required. You must create a trust relationship between the master servers. You must also add the local master server (where you plan to run nbdeployutil) to the Servers list on each remote master server.
  See “Configure the servers list for usage reporting” on page 195.
  See “Track backup data size on your master servers” on page 194.

Additional information

Scheduling capacity licensing reports. Details on capacity licensing, scheduling, and options for capacity licensing reports.

Veritas Smart Meter Getting Started Guide. Details on how to use Smart Meter to manage your NetBackup deployment and licensing. This tool provides accurate, near real-time reporting for the total amount of data that is backed up.

Configure the servers list for usage reporting

If a you want to add usage reporting information for a master server but that server does not have an internet connection, you need to add the name of the local master server to the servers list of the remote master server. The local master server is where you plan to run nbdeployutil.
To add a server to a list

1. On the remote master server, log on as root or administrator.
2. In the NetBackup Administration Console, in the left pane, expand `NetBackup Management > Host Properties`.
3. Select `Master Servers`.
4. In the right pane, double-click the master server that you want to modify.
5. In the properties dialog box, in the left pane, click `Servers`.
6. Select the `Additional Servers` tab.
7. Click `Add`.
8. In the `Add a New Server Entry` dialog box, enter the name of the master server where you plan to run `nbdeployutil`.
9. Click `Add`. The dialog box remains open for another entry.
10. Click `Close`.

Scheduling reports for capacity licensing

By default, NetBackup triggers `nbdeployutil` to run on a specified schedule to incrementally gather data and to generate licensing reports. For the first run, the duration of the report uses the frequency that is specified in the configuration file.

For capacity licensing, the report duration is always for the last 90 days based on the availability of the gathered data. Any data older than 90 days is not considered in the report. Each time `nbdeployutil` runs, it gathers information for the time between the latest run of `nbdeployutil` and the previous successful run.

Licensing report location

The current capacity licensing report resides in the following directory:

On Windows: `install_path\NetBackup\var\global\incremental`

On UNIX: `/usr/openv/var/global/incremental`

It contains the following files:

- The generated report for the latest `nbdeployutil` result.
- Folders containing incrementally gathered data.
- The archive folder that contains the older generated reports.
- `nbdeployutil` log files.
The older reports are placed in the archive folder. Veritas recommends that you retain at least 90 days of reporting data. Data can be kept longer than 90 days, depending on the requirements of your environment. Older reports can help to show how the capacity usage has changed over time. Delete the reports or the folder when they are no longer required.

**Use Case I: Using the default values for the licensing report**

The `nbdeployutilconfig.txt` file is not required when you use the default parameters. `nbdeployutil` uses the following default values for capacity licensing:

- **FREQUENCY_IN_DAYS=7**
- **MASTER_SERVERS=local_server**
- **PARENTDIR=folder_name**
  
  For Windows: `install_path\NetBackup\var\global\incremental`
  
  For UNIX: `/usr/openv/var/global/incremental`

- **PURGE_INTERVAL=120** (number of days)
- **MACHINE_TYPE_REQUERY_INTERVAL = 90** (number of days)

**Use Case II: Using custom values for the licensing report**

If the file `nbdeployutilconfig.txt` is not present, create a file using the following format:

```
[NBDEPLOYUTIL_INCREMENTAL]
MASTER_SERVERS=<server_names>
FREQUENCY_IN_DAYS=7
PARENTDIR=<folder_name_with_path>
PURGE_INTERVAL=120
MACHINE_TYPE_REQUERY_INTERVAL=90
```

**To use custom values for the licensing report**

1. Copy the `nbdeployutilconfig.txt` file to the following location:

   For Windows: `install_path\NetBackup\var\global`

   For UNIX: `/usr/openv/var/global`

2. Open the `nbdeployutilconfig.txt` file.
3 Edit the **FREQUENCY_IN_DAYS** value to reflect how often you want the report to be created.

- **Default (recommended)**: 7
- **Minimum**: 1
- **Value of 0**: Disables the incremental reporting and no licensing information is captured.

Parameter deleted **nbdeployutil uses the default value.**

4 Edit the **MASTER_SERVERS** value to include a comma-separated list of the master servers you want to include in the report.

**Note**: Veritas Smart Meter requires that master servers be at NetBackup 8.1.2 or later.

Parameter deleted **nbdeployutil uses the default value.**

For example:

- **MASTER_SERVERS=newserver, oldserver**
- **MASTER_SERVERS=newserver, oldserver.domain.com**
- **MASTER_SERVERS=myserver1.somedomain.com, newserver.domain.com**

5 Edit the **PARENTDIR** value to include the full path for location where the data is gathered and reported.

Parameter deleted **nbdeployutil uses the default value.**
6 Edit the `PURGE_INTERVAL` to indicate the interval (in days) for how often you want to delete the report data. Data that is older than 120 days is automatically purged.

Default 120
Minimum 90
No value `nbdeployutil` uses the default value.
Parameter deleted `nbdeployutil` uses the default value.

7 Edit the `MACHINE_TYPE_REQUERY_INTERVAL` to indicate how often to scan physical clients for updates to the machine type.

Default 90
Minimum 1
No value `nbdeployutil` uses the default value.
Parameter deleted `nbdeployutil` uses the default value.

Other configuration for incremental reporting

To change the directory of the gathered data and capacity licensing report

1 If you have older gathered data and licensing reports, copy the complete directory to the new location.

2 Edit `nbdeployutilconfig.txt` and change the location of the gathered data and licensing report in the `PARENTDIR=folder_name` field.
To use the data that was gathered previously to generate a capacity licensing report

1. Locate the folder that was generated for the gathered data after the previous run of nbdeployutil and copy it to the following location:
   - On Windows: `install_path\NetBackup\var\global\incremental`
   - On UNIX: `/usr/openv/var/global/incremental`

2. Create the `gather_end.json` file inside the copied folder and add the following text:
   ```json
   {"success":0}
   ```

   The next incremental run considers the data inside the copied folder to generate a capacity licensing report.

   **Note:** Delete any other gather folders inside the copied folder to avoid gaps for the period in which data is gathered. The missing data is automatically generated during the next incremental run.

To create a custom interval report using existing gathered data for capacity licensing

- To create a report for a time interval that is different than the default interval of 90 days, run the following command:

  **On Windows:**
  ```
  nbdeployutil.exe --capacity --incremental --report --inc-settings "install_dir\netbackup\var\global\nbdeployutilconfig.txt" --hoursago <custom-time-interval>
  ```

  **On UNIX:**
  ```
  nbdeployutil.exe --capacity --incremental --report --inc-settings "/usr/openv/var/global/nbdeployutilconfig.txt" --hoursago <custom-time-interval>
  ```

  The number of hours specified in `--hoursago` must be fewer than the purge-interval that is specified in the `nbdeployutilconfig.txt` file.

  **Note:** `nbdeployutil` uses existing gathered data to generate the custom interval report. You are not required to use the `--gather` option.
Troubleshooting failures for `nbdeployutil` and incremental reporting

- `nbdeployutil` fails to gather data and generate the report for your environment. Refer to the logs to understand when the task failed and the reason for the failure.

- `nbdeployutil` fails with a bpimagelist error with status 37 after you run the utility manually. Ensure that you added the master servers to the additional servers list.

- For Oracle Real Application Clusters (RAC), protected data size may be reported more than once because the size is reported for the node where data backup happens.
  If the backup operation is initiated from different nodes in the Oracle Real Application Clusters (RAC), the capacity licensing report displays a separate row for every node.

- The following error displays because of internal web service communication failures:
  Report for master server `SERVER_NAME` is generated using the backup image header method instead of accurate licensing method because of web service interruptions during the gather phase.

- For VMware or NDMP, when the backup agent fails to post licensing information to the database, a status code 5930 or 26 displays in the Activity Monitor: For more information, see the NetBackup Status Codes Reference Guide.
Veritas Resiliency Platform

- Chapter 16. Managing Resiliency Platforms
Managing Resiliency Platforms

This chapter includes the following topics:

■ About Resiliency Platform in NetBackup
■ Understanding the terms
■ Configuring a Resiliency Platform
■ Troubleshooting NetBackup and Resiliency Platform issues

About Resiliency Platform in NetBackup

You can integrate NetBackup and Veritas Resiliency Platform to manage your disaster recovery operations. Veritas Resiliency Platform provides a single console from which you can proactively maintain business uptime across private, public, and hybrid clouds. Integrating NetBackup and Resiliency Platform lets you leverage the capabilities, such as complete automation, visualizing and monitoring DR specific information for all resiliency operations for the virtual machines in your data center.

Note the following points:

■ You can integrate more than one Resiliency Platform with your NetBackup master server.
■ You can have more than one data centers for a Resiliency Platform.
■ You can use Resiliency Platform with Veritas Resiliency Platform version 3.5 and later in NetBackup.
■ After you add a Resiliency Platform, the assets are automatically discovered and displayed on the Virtual machines tab.
You can view detailed information alerts and error messages in the **Notifications** section.

## Understanding the terms

The following table explains the key components related to Veritas Resiliency Platform and NetBackup integration.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resiliency Platform</td>
<td>The Veritas Resiliency Platform integrated with your NetBackup master server. The Resiliency Manager provides the services required for protecting assets, such as virtual machines, within a resiliency domain. It also provides workload automation services.</td>
</tr>
<tr>
<td>Resiliency manager</td>
<td>The component that provides resiliency capabilities within a resiliency domain. It is composed of loosely coupled services, a distributed data repository, and a management console.</td>
</tr>
<tr>
<td>Infrastructure management server (IMS)</td>
<td>The component that discovers, monitors, and manages the asset infrastructure within a data center. The IMS transmits information about the asset infrastructure to the Resiliency Manager. The IMS is deployed as a virtual appliance. To achieve scale, multiple IMSs can be deployed in the same data center.</td>
</tr>
<tr>
<td>Data center</td>
<td>The location that contains source data center and a target data center. Each data center has one or more IMSs.</td>
</tr>
<tr>
<td>Resiliency group</td>
<td>The unit of management and control in Resiliency Platform. You organize related assets into a resiliency group and manage and monitor them as a single entity.</td>
</tr>
<tr>
<td>Automated virtual machines</td>
<td>The assets that are a part of a resiliency group and you can perform actions, such as migrate, takeover, rehearse, and restore.</td>
</tr>
<tr>
<td>Recovery readiness</td>
<td>Measured based on migrate, takeover, restore or rehearsal operations.</td>
</tr>
<tr>
<td></td>
<td>- Low - If no operations are performed or failed.</td>
</tr>
<tr>
<td></td>
<td>- High - If at least one operation is performed successfully in the past 7 days.</td>
</tr>
<tr>
<td></td>
<td>- Medium - If the recovery readiness does not fall in either high or low category.</td>
</tr>
<tr>
<td>Term</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Recovery Point Objective (RPO)</td>
<td>Recovery Point Objective is the point in time you can recover to in the event of a disaster. For example, if you have an RPO of 4 hours on your critical virtual machines then you lose 4 hours of data, as 4 hours ago is the last point in time to which you can recover data on your VMs.</td>
</tr>
</tbody>
</table>

## Configuring a Resiliency Platform

You can add, edit, delete, or refresh a Resiliency Platform. You can add more than one Resiliency Platform in NetBackup.

### Add a Resiliency Platform

You can add one or more than one Resiliency Platforms in NetBackup. The Resiliency Platform lets you add virtual machines and automate protection. If the resiliency manager is using a third-party certificate, see the NetBackup Web UI Administrator's Guide.

**To add a Resiliency Platform**

1. On the left, click **Resiliency**.
2. Click the **Resiliency Platform** tab.
3. Click **Add Resiliency Platform**.
4. Read the instructions on the **Add Resiliency Platform** dialog box and click **Next**.
5. In the **Add credentials** dialog box, enter a value in the following fields and click **Next**:
   - Resiliency manager host name or IP address
   - Resiliency Platform API access key
   - NetBackup API access key
6. In the **Add data center and Infrastructure management server** dialog box, select a data center.
7. In the **Infrastructure management server** section, select a preferred server.
8. Click **Add**.

After you add the Resiliency Platform in NetBackup, the NetBackup master server will be configured automatically in the Resiliency Platform.
Configuring a third-party CA certificate

You can use a self-signed or a third-party certificate to validate your Resiliency manager.

Consider the following points:

- For Windows, you can give a certificate as a file path or install the third-party certificate in the Trusted root certificates authorities.
- To switch from a self-signed certificate to a third-party certificate for an already added Resiliency Platform, you can edit the Resiliency Platform.

To configure a third-party CA certificate

1. Copy a PKCS #7 or P7B file having certificates of the trusted root certificates authorities that are bundled together. This file may either be PEM or DER encoded.
2. Create a CA file containing the PEM encoded certificates of the trusted root certificate authorities that are concatenated together.
3. In the bp.conf file, create the following entries, where certificate.pem is the file name:
   - ECA_TRUST_STORE_PATH = /certificate.pem
   - Verify that the nbwebsvc account has the permissions to access the path that ECA_TRUST_STORE_PATH refers.

Editing or deleting a Resiliency Platform

After you add a Resiliency Platform, you can edit the Resiliency Platform and NetBackup API access keys. You cannot change or update the Resiliency manager host name or IP address. However, you can delete the Resiliency Platform and add it to NetBackup again. If you refresh the Resiliency Platform, the discovery of assets on the Resiliency Platform is triggered.

To edit a Resiliency Platform

1. On the left, click Resiliency.
2. Click the Resiliency Platform tab.
3. Click the Actions menu for the Resiliency Platform that you want to edit and select Edit.
4. Enter the updated Resiliency Platform API access key and NetBackup API access key.
5. Click Next.
6 In the **Edit data center and Infrastructure management server** dialog box, select the **Data center** and then select the preferred infrastructure management server.

7 Click **Save**.

8 To delete a Resiliency Platform, from the **Actions** menu, select **Delete**.

### Viewing the automated or not-automated VMs

The virtual machines that belong to a resiliency group in Veritas Resiliency Platform are discovered and displayed on the **Automated** tab and the VMs that don't belong any resiliency group are displayed on the **Not automated** tab. You can view the status of the assets and perform various actions. You can search for a VM or apply filters too.

The following table lists the columns displayed on the **Automated** and **Not automated** tabs:

<table>
<thead>
<tr>
<th>Tab</th>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automated</td>
<td>Name</td>
<td>Name of the virtual machine.</td>
</tr>
<tr>
<td>Not automated</td>
<td>Name</td>
<td>Name of the virtual machine.</td>
</tr>
<tr>
<td>Automated</td>
<td>RPO</td>
<td>Recovery Point Objective is the point in time you can recover to in the event of a disaster. For example, if you have an RPO of 4 hours on your critical virtual machines then you lose 4 hours of data, as 4 hours ago is the last point in time to which you can recover data on your VMs.</td>
</tr>
<tr>
<td>Automated</td>
<td>State</td>
<td>Whether the VM is switched on or off.</td>
</tr>
</tbody>
</table>
### Table 16-1 (continued)

<table>
<thead>
<tr>
<th>Tab</th>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automated</td>
<td>Recovery readiness</td>
<td>Measured based on migrate, takeover, restore or rehearsal operations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ Low - If no operations are performed or failed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ High - If at least one operation is performed successfully in the past 7 days.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ Medium - If the recovery readiness does not fall in either high or low category.</td>
</tr>
<tr>
<td>Not automated</td>
<td>Platform</td>
<td>The platform that the VM belongs to.</td>
</tr>
<tr>
<td>Automated</td>
<td>Server</td>
<td>The server name of the VM.</td>
</tr>
<tr>
<td>Not automated</td>
<td>Protection</td>
<td>Protection status of the VM.</td>
</tr>
<tr>
<td>Automated</td>
<td>Resiliency group</td>
<td>Name of the resiliency group to which the VM belongs.</td>
</tr>
<tr>
<td>Not automated</td>
<td>Recovery action</td>
<td>Launch the Resiliency Platform to add the VM to a resiliency group.</td>
</tr>
</tbody>
</table>

**To view and perform actions on automated VMs**

1. On the left, click **Resiliency**.
2. On the **Virtual machines** tab, click **Automated**.
3. To view more details about a VM, in the **Name** column, click a VM.
4. To view all VMs that are a part of the same resiliency group, click the preferred resiliency group.
To perform disaster recovery operation, such as rehearse, restore, or recover, click Launch Resiliency Platform.

To enable single-sign, same authentication domain must be configured NetBackup and Veritas Resiliency Platform. If not configured, you must login with username and password to access Veritas Resiliency Platform web console.

6 Log on to your Resiliency Platform and perform the preferred action. See the Veritas™ Resiliency Platform User Guide.

To view and perform actions on not automated VMs

1 On the left, click Resiliency.

2 On the Virtual machines tab, click Not automated.

3 To add the VM to a resiliency group, in the Recovery action column, click Automate Recovery.

4 Perform the preferred action for your Resiliency Platform. See, the Veritas™ Resiliency Platform User Guide.

Troubleshooting NetBackup and Resiliency Platform issues

Use the following information to troubleshoot issues.

Table 16-2 Troubleshooting issues

<table>
<thead>
<tr>
<th>Issue</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Failed to configure the current NetBackup master server with the Resiliency Platform.</td>
<td>Check the logs at the following location in Veritas Resiliency Platform's Resiliency manager:</td>
</tr>
<tr>
<td></td>
<td>■ /var/opt/VRTSitrp/logs/copydata-service.log</td>
</tr>
<tr>
<td></td>
<td>■ /var/opt/VRTSitrp/logs/api-service.log</td>
</tr>
<tr>
<td>Failed to establish a persistent connection between the current NetBackup master server and the Resiliency Platform.</td>
<td>Verify that the logged in user has permissions in credentials namespace.</td>
</tr>
<tr>
<td></td>
<td>■ /usr/openv/logs/nbwebservice/ in NetBackup installation directory</td>
</tr>
<tr>
<td></td>
<td>■ C:\Program Files\Veritas\NetBackup\logs\nbwebservice in NetBackup windows</td>
</tr>
<tr>
<td>Issue</td>
<td>Action</td>
</tr>
<tr>
<td>---------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Failed to launch the Veritas Resiliency Platform</td>
<td>Verify that same authentication domain is used to configure Veritas Resiliency Platform and NetBackup.</td>
</tr>
</tbody>
</table>
Managing credentials

- Chapter 17. Managing external KMS and workload credentials
Managing external KMS and workload credentials

This chapter includes the following topics:

- About credential management in NetBackup
- Add a credential in NetBackup
- Edit a credential
- Delete a credential
- Select or add credentials to SQL Server instances or replicas

About credential management in NetBackup

The Credential management node in the NetBackup web user interface provides the ability to centrally manage credentials that NetBackup uses.

In NetBackup 8.3, you can create and manage credentials for the following systems:

- An external key management service (KMS) server
- Microsoft SQL Server

Adding credentials comprises the following steps:

- Add the basic credential properties (for example, credential name or tag)
- Assign a category to the credential (for example: Microsoft SQL Server or External KMS server)
- Assign the required permissions to access the credentials
Add a credential in NetBackup

You can add credentials that NetBackup uses to connect to various systems.

To add a credential

1. On the left, click Credential management.
2. Click Add.
3. Add the following basic properties:
   - Credential name (for example: sqlserver_cred1)
   - Tag (for example: sqlserver)
   - Description (for example: This credential is used to access sqlserver)
4. Click Next.
5. Select a credential category and the respective credential details that you want to assign to this credential.

External KMS

Select to assign the credential to the external KMS server that you have configured.

Provide the following credential details of the external KMS server that are used to authenticate the communication between the NetBackup master server and the external KMS server:

- Certificate - Specify the certificate file contents.
- Private Key - Specify the private key file contents.
- CA Certificate - Specify the CA certificate file contents.
- Passphrase - Enter the passphrase of the private key file.
- CRL Check level - Select the revocation check level for the external KMS server certificate.

CHAIN - The revocation status of all the certificates from the certificate chain are validated against the CRL.
DISABLE - Revocation check is disabled. The revocation status of the certificate is not validated against the CRL during host communication.
LEAF - The revocation status of the leaf certificate is validated against the CRL.

See the NetBackup Security and Encryption Guide for more information on external KMS configuration.
Select to assign the credential to SQL server that you have configured.

Use one of the following options:
- Use credentials that are defined locally on the client
- Provide Microsoft SQL Server credentials

6 Click **Next**.

7 Click **Add** to assign permissions to a specific role to access this credential.

See “Credentials” on page 81.

8 Click **Next** and follow the prompts to complete the wizard.

## Edit a credential

You can edit a credential when you want to change the credential tag, description, category, or permissions. You cannot change the credential name.

**To edit a credential**

1. On the left, click **Credential management**.
2. Locate and click on the credential that you want to edit.
3. Click **Edit**.
4. Edit the credential as required.
5. After all the changes are reviewed, click **Finish**.

## Delete a credential

You can delete a credential that you no longer need.

**To delete a credential**

1. On the left, click **Credential management**.
2. Locate and click on the credential that you want to delete.
3. Click **Delete**.
Select or add credentials to SQL Server instances or replicas

To allow for full discovery of SQL Server assets, you must add or select the server credentials for the instances or replicas. Review the requirements for the SQL Server credential option that you want to use.

See “About Microsoft SQL Server credentials” on page 216.

To select or add credentials to SQL Server instances or replicas

1. On the left, click Credential management.
2. Click Add.
3. Provide a Credential name and click Next.
4. From the Category list, select Microsoft SQL Server.
5. Choose one of the following options. Specific RBAC permissions are required to be able to select or to add credentials to a SQL Server asset.

   See the NetBackup Web UI Administrator's Guide or contact your NetBackup administrator for assistance.

Select from existing credentials
Select the credential that you want to use for the selected assets and click Next.

Add credentials
Select one of the following options:

- **Use credentials that are defined locally on the client** and click Next.
- **Use these specific credentials**
  Provide the User name, password, and Domain that are associated with the credentials. Click Next.

See “About Microsoft SQL Server credentials” on page 216.

A SQL Server administrator can view and add a credential to an asset if that user has the necessary RBAC permissions.

See “Role permissions” on page 43.

6. The Permissions screen displays the roles that have access to the credential.
7. Click Next. Review the credential settings and click Finish.

The registered date reflects the date and time the credential was added or updated and does not indicate if the credentials are valid.
About Microsoft SQL Server credentials

To protect SQL Server, you must add (or register) credentials to the SQL Server instances or availability replicas. The NetBackup web UI supports Windows authentication and Windows Active Directory authentication. It does not support Mixed Mode or SQL Server authentication. Credentials are not supported at the database or the availability group level.

Table 17-1 Options to register credentials

<table>
<thead>
<tr>
<th>Option to register credentials</th>
<th>Environment and configuration</th>
</tr>
</thead>
</table>
| Use these specific credentials (recommended) | - The SQL Server DBA provides the NetBackup administrator with the SQL Server user credentials.  
- The SQL Server DBA does not want the NetBackup services running as a privileged SQL Server user on the client. |
| Configuration requirements | The user account that is used to register credentials must have the SQL Server “sysadmin” role and be a member of the Windows Administrators group.  
The NetBackup services can use the Local System logon account. If you want to use a different logon account, that account must also have certain local security privileges. |
| Use credentials that are defined locally on the client | - The NetBackup services run as a privileged SQL Server user on the client.  
- The SQL Server DBA does not want to provide credentials to register instances or replicas.  
- The NetBackup administrator does not have access to the SQL Server credentials. |
| Configuration requirements | The user account that is used to register credentials must have the SQL Server “sysadmin” role and be a member of the Windows Administrators group.  
You must also configure the logon account for the NetBackup services. |

Registering instances when SQL Server hosts are clustered or use multiple NICs

When NetBackup discovers a SQL Server cluster, it adds a single entry on the Instances tab. This instance represents all nodes in the cluster. The host name is the virtual name of the SQL Server cluster. When you add credentials for this instance NetBackup validates the credentials on the active node. The credentials must be valid for all nodes in the cluster.

When NetBackup discovers a SQL Server host that uses multiple NICs, it adds an entry using the NetBackup client name on the Instances tab. If you installed the
NetBackup client using the public interface name, you must configure the NetBackup client name as the private interface name. Then add credentials to the instance with its private interface name. For a SQL Server cluster that uses multiple NICs, add credentials to the instance with the private virtual name of the SQL Server cluster.

See the NetBackup for SQL Server Administrator's Guide or ask your NetBackup administrator for assistance.

Registering Microsoft SQL Server failover cluster instances (FCIs)

NetBackup discovers and displays failover cluster instances (FCIs) under the cluster name and the physical node names. For example, instance FCI is enumerated with both its physical nodes hostvm10 and hostvm11 and with its cluster name sql-fci. Databases that exist for FCIs are also enumerated with the node names and the cluster name. Depending on how you want to protect a database, add credentials to either the cluster name (that are valid for all nodes) or to a physical node name.

Validation of credentials

After you add credentials, NetBackup validates the credentials and starts database and availability group discovery. When discovery completes, the results are displayed on the Databases or the Availability group tab.

For a SQL Server cluster or if an availability group instance is part of SQL Server cluster, NetBackup validates the credentials on the active node. The credentials must be valid for all nodes in the cluster. For a SQL Server availability group, replicas are registered and validated individually. Note that the registered date reflects the date and time the credential was added or updated and does not indicate if the credentials are valid.

See the NetBackup for Microsoft SQL Server Administrator's Guide.

Configuring the NetBackup services for SQL Server backups and restores

For policies and protection plans with the NetBackup web UI, NetBackup uses the NetBackup Client Service and the NetBackup Legacy Network Service to access the SQL Server when it performs backups and restores.

Note the following requirements for the NetBackup services logon account:

- The account must have the SQL Server “sysadmin” role.
- If you want to use Local System for the logon account, apply the SQL Server sysadmin role manually to the NT AUTHORITY\SYSTEM or the BUILTIN\Administrators group.
To configure the NetBackup services for SQL Server backups and restores

1. Log on to the Windows host with the account that has the SQL Server sysadmin role and any necessary local security privileges.

2. In the Windows Services application, open the NetBackup Client Service.

3. Confirm that Local System account or a SQL Server administrator account is configured.

   If you use the setting Use credentials that are defined locally on the client to register instances, both services must use the same logon account. If you use the setting Use these specific credentials to register instances, the services can use the same logon or separate logon accounts.

4. Open the NetBackup Legacy Network Service.

5. Confirm that Local System account or a SQL Server administrator account is configured.

   If you use the setting Use credentials that are defined locally on the client to register instances, both services must use the same logon account. If you use the setting Use these specific credentials to register instances, the services can use the same logon or separate logon accounts.

6. If you selected a different logon account, restart the services.

7. If you selected the option Use these specific credentials, an account other than Local System requires certain local security privileges.

   See “Configuring local security privileges for SQL Server” on page 218.

Configuring local security privileges for SQL Server

If you use the option Use these specific credentials to create a credential, an account other than Local System requires certain local security privileges. These privileges are necessary since the NetBackup for SQL Server agent logs on as the SQL Server user when it accesses data.

Note: This configuration applies to local security privileges only. For domain-level privileges, contact your domain administrator.

To configure the local security privileges

1. Open the Local Security Policy.

2. Click Local Policies.

3. In the User Rights Assignment, add the account to the following policies:
   - Impersonate a client after authentication
Replace a process level token

4 Run the group policy update command (gpupdate /Force) for this change to take effect:

    gpupdate /Force

5 If the NetBackup Client Service and the NetBackup Legacy Network Service use this account to log on, restart these services.

6 For a SQL Server cluster, configure the local security privileges on each node in the cluster. For SQL Server availability groups, configure the services on all replicas where you want to run backups.
